109-22

THE

Meaver and Housewife's Pocket-book?

CONTAINING

RULES

OR

The right Making of Linen Cloth,

Wherein is shown,

What should be the Weight of each Hank of Yarn, that is fit for any Hundred of the Reed; and likewise, the Number of right telled Yarn, in Spinels, Slips, and Cuts, that will be sufficient to make any Number of Ells, from 1 to 60, in a 6 to a 25 Hundred inclusive.

WITH

Several useful Tables of Dutch Weight, and the Measure of the Dutch Reeds on the Scots Ell.

To which is subjoined,

A distinct Receipt for boiling of Yarn after the Dutch

Method.

All necessary for the Improvement of the Linen Trade.

By DAVID RAMSAY Weaver in Dalkeith.

Entred in Stationers Hall,

Printed for the Author, and fold by him in Dalkeith,

PREFACE.

each Sup of Care, circ will HE Linen Manufacture in Scotland, being a most valuable Branch of its Trade; and Persons of all Ranks having of late very much distinguished themfelves, by their most laudable Attempts towards its Improvement, in which they have happily succeeded, to the great Benefit and Glory of their Country; and it being the Duty of every one, who fincerely wishes the Welfare of it, to contribute what they can to so valuable a Purpose, I have presumed to offer the Publick some Rules and Regulations for the right Making of Linen Cloth: Altho, a great many have attained to great Improvement on the Subject; yet, it is humbly hoped, these Rules will help Apprentices and Journey. men, in some Measure, for their further Improvement.

I have

I have confined this little Book within as narrow Bounds as possible, that it may be fold cheap; where, every one that understands Figures will plainly see the Weight of each Slip of Yarn, that will be fit for any Hundred, from a 6 to a 25 Hundred inclusive; and likewise, the Number of Spinels, Slips and Cuts, that will be sufficient for making any Number of Yards of Cloth from t to 60 Yards; which will be useful, as is hoped, not only for Apprentices and Journeymen; but every Housewife may, by the Help of this little Book, know how to prepare her Yarn, and have it right woven into Cloth, so as to answer the Market; and thus not a little contribute to the Improvement of our Linen Trade.

RULES

(7)

RULES to be observed in making of plain Linen Cloth.

Of Yarn in general.

ment, is to be reeled on a Reel of 10 Quarters of a Yard, or 90 Inches in Circumference; the Half of the Length, when folded together, is 45 Inches, which is allowed for one Ell of Cloth, which, with the Thumb-breadth, or Inch to the Ell, makes 38 Inches. The Difference betwixt 45 Inches of Yarn, and 38 Inches of Cloth, is 7 Inches, which is allowed to fink up in the Weaving and Bleaching.

N. B. That all Yarn must be reeled and tied up according to Order; that is to say, each Spinel of Yarn is to contain 4 Slips or Hanks, and each Slip or Hank is to contain 12 Cuts, and each Cut is to contain 120 Threads: Now, there being 120 Threads in one Cut, this makes 6 Porters to one Hundred of the Reed, whether sine or coarse; be-

cause

(8)

cause 20 Threads make one Porter, and 5 Porters make one Hundred: Now, one Slip, or 12 Cuts, will be 12 Times 6 which is 72 Porters, or 14 Hundred and 2 Porters for one Ell of Cloth.

Ail Table of the Tellof Yarn.

io lead a no believe of its in one spinel.

A Slips of Hanks in one Spinel.

A Slips of Hanks in one Spinel.

volis Slips in one Slip of Hank.

all 21 Cuts in one Spinel.

48 Cuts in one Spinel.

120 Threads in one Cut.

N. B. That all along thro' this Book, it is supposed the Yam is just recled, and right telled; for in an exact Calculation of this kind, there is no Allowance for Deficiency, either of bad Tell or short. Reels: The Maker, and not the Buyer, is to suffer for bad Tell, and unjust Reels.

5760 Threads in one Spinel

N. B. That the first Column towards the left Hand, is the Hundreds of Warps; and opposite to them, is, the Number of Cuts and Threads that will warp one Ell of such a Hundred; and the last Column, is the Loops, or Porters, that is contained in such a Number of Threads; as for Example, and one will serve for both this and several other Tables.

Suppose you want to know how much Yarn will warp one Ell of a 13 Hundred in the Column of Hundreds, and opposite to it stands 10 Cuts and a 100 Threads, or 5 Loops or Porters, which is the Number of Yarn that 13 Hundred of Warp will require for one Ell: And 10 of all the rest in this Table.

Tables, observe the true Calculation as was said before, that is to say, 20 Threads make one Loop or Porter; and 6 Loops or Porters, make one Cut; and 12 Cuts make one Slip; and 4 Slips make one Spinel: Likewise in some Hundreds, it will take equal Yarn in Cuts for one Ell. As for Example, I shall suppose a 12 Hundred; now if 12 Hundred be multiplied by 5, the Porters in one Hundred will produce 60 Porters: Now if one Cut will give 6 Porters, for one Ell-of any Hundred, consequently 10 Cuts must give 60 Porters of Warp, which is equal to 12 Hundred, as may be seen in the foregoing Table.

Secondly, Every Hundred of Warp will not agree with equal Cuts of Yarn for one Ells Warp. For a second Example, Take a 15 Hundred; now 15 Hundred being multiplied by 5, produces 75 Porters, and every Cut is to give 6 Porters, consequently 12 Cuts gives 72 Porters, and then I want 3 Porters, or Loops, to make out 75, which is 60 Threads, or 3 Loops, as you may see in the Table which will warp one Ell of a 15 Hundred.

There may be some Difficulty in a sewer Number of Ells, for some Hundreds; but as the following Table will shew the exact Number of Yarn for any Hundred, and Number of Ells; and when the Number of Ells turn high, the odd Threads, or Porters, make very often equal Yarn, in Spinels, Slips, and Cuts: And as this is the old Way of calculating of Warps, I shall give a Table for each Hundred, only for Warps, and then give other Tables for Warp and Woof together, which will be an exact Calculation.

N. B. That the Characters of each Column, is marked in the Tables, a Y. for Yards, S. for Spinels. Sl. for Slips, and C. for Cuts, L. for Loops, on the Top of each Column, and when Hundreds occur in some Tables, H.

(11)

These TABLES shew how much true counted Yarn will warp a 6 and 7 Hundred, from I Ell to 60 Ells.

Is the Mumber of Ells from one to 60; and the next opposite Columns, is the Spinels. Slips, Cuts, and Loops, that any of the said Number of Ells will require.

EXPLA-

(21)

EXPLANATION of the foregoing Tables.

EXAMPLE, and one will serve for all.

Suppose you want to know how much Yarn will warp 40 Yards of 12 Hundred dook in the Table of 12 Hundred, and opposite to 40 Yards stands 9 Spinel, 1 Cut, and 2 Loops, which will warp 40 Yards; and for 50 Yards stands opposite, 11 Spinel, I Slip, I Cut, and 4/Loops, which will warp 50 Yards; but if you should require 35 Yards; add the Number of Yarn that Rands opposite to 30 Yards, and the Number of Yarn that stands opposite to 5 Yards together, and that will amount to 7 Spinel, 3 Slips, 7 Cuts, and 1 Loop, which is the Number of Yarn that 35 Yards will require: and fo for any other odd Number of Yards, as 41, 42, 43, 44, &c., always adding the first greatest Number, and the next leffer together, which makes up the Sum of Yarn, all 12/21, One to to to the

As there is no Wost mentioned in the 20 foregoing Tables, the Proportion will be in the Dutch Method at 6 Spinel Warp to 5 of Woof; but if they be fine of the Set, it will take 8 to 7, or 9 to 8; and as a great many Persons are of Opinion, especially the Irish, that setting them one Set siner of Warp, by which Means they take a greater Quantity of Woof, and confequently brings the Cloth nearer to a Square, the Proportion in the Irish Method, will be as 13 Spinel of Warp is to 12 Spinel of Woof, or near equal; and I am of Opinion that this Way would answer private Perfons better than the Dutch Method, because a great many have not a Stock of Yarn to make fuch a Piece, or Pieces, of Cloth. The 20 following Tables will shew how much true counted Yarn will make any Number of Yards in Warp and Woof; and as the Length of the Reels and Tell of Yarn was mentioned before, I shall give a fecond Direction as follows; 45 Inches of Yarn being too long for one Yard of Cloth, I shall allow that 42 or 41½ Inches, without taking a very strick salculation on Inches, or Parts of Threads, which would be troublesome for those that want Figures, but 42 Inches, for 41½ his to be allowed for the Length of one Yard, which is 36 Inches, and the Thumb-Breadth makes 37 Inches, the Difference to sink up in the weaving is 4½ or 5 Inches, and then there remains 3½ long Inches over, which will amount, in one Slip of Yarn, to about Half a Cut, which being added to the sormer Calculation, 72 Porters, linakes 75 Porters, which is 15 hundred Warp: That by this Rule, one Slip of Yarn will give 15 hundred of Warp for one Yard of Cloth.

Before I begin with the Tables, take these sew Directions; first, If ye take 14 Cuts; for one Yard of Cloth, for one Hundred of the Reed, whether sine or coarse, it will be a standing Rule for the better understanding of the following Tables: Suppose ye want to know how much Yarn will warp and woof a 12 Hundred, for one Yard's Length, then say in your Mind, 12 Cuts for 12 Hundred, and 12 Half Cuts for 12 Hundred, is 6 whole Cuts, which being added together, makes 18 Cuts, or 1 Slip and 6 Cuts, which will warp and woof one Yard of a 12 Hundred.

and woof one Yard of a 12 Hundred.

Secondly, For 20 Yards of a 12 Hundred, how much Yarn will it take for Warp and Woof? fay by the foregoing Rule, 20 Guts, and 20 half Cuts, which is 10 Guts being added together, makes 30 Guts, which is 2 Slips and 6 Cuts for one Hundred; now 12 Hundred is the Question, then fay, 12 and 12, is 24 Slips, and the Half of 12 is 6, which being added together makes 30 Slips, which is 7 Spinel and 2 Slips, that will warp and woof 20 Yards of a 12 Hundred; and 60 of all the rest throughout all the following Tables:

(23)

These TABLES shew how much true counted Yarn will warp and woof a 6 and 7 Hundred, from one Yard to 60 Yards.

2	5	1 1	1	4	2	1. 7	2

N. B. That the first Column towards the lest Hand, is the Hundreds of the Reed; and next opposite to them, is the Weight of Yarn per Hank, sit for any of the said Hundreds; and the other 3 Columns, is the Slips, Cuts, and Threads (omiting Fractions of Threads) that is contained in one Pound of the said Weight.

Example.

If each Slip of your Yarn that is designed for Warp, weigh $2\frac{1}{2}$ Ounces Dutch Weight; then opposite to $2\frac{1}{2}$ Ounces, stands 18 Hundred, which is the Reed that that Fineness of Yarn may be wrought in, and it is 6 Slips, 4 Cuts, and 96 Threads, that will weigh one Pound of that Yarn.

It is not supposed that every one that maketh Cloth can have all their Yarn of fuch an equal Weight, for that would require a great Stock of Yarn to manufacture the Cloth according to this Weight: But suppose the whole of your Yarn be not of an equal Weight, I shall take a 12 Hundred; now each Slip in the Table is to weigh 41 Ounces, but if Part of your Yarn weigh 4 Ounces, and Part of it 44 Ounces, then your Yarn is of two Kinds of Weight: Wind all the 4 Ounce Yarn on the equal Half of the Bobens, and all the 41 Ounce Yarn on the other Half, then mark them, and fet them in the warping Boben about, otherwise if you do not take particular Care, perhaps most of the coarfest of the Yarn may fall on the Side or Middle of the Web, or otherwise it may fall on the Side of a Porter, or Gang, and consequently it will make some Parts of the Cloth thick, and some Parts thin, which spoils the Beauty of the Cloth. Any other Hundred of the Reed, may be made the same Way in coarse Pieces, with them that hath not a good Stock of Yarn, as a 8 Hundred with Part of 7 Ounces, and Part of 71 Ounces, or 8 Ounces, as the Yarn is coarse, so little discerned in the Odds of Half an Ounce, or an Ounce; and so of all the other Hundreds, observing the foregoing Direction of dividing the Yarn equally according to the Weight; for the Wofts again, according to this kineness of Warps, will be from a 6 to a 10 Hundred; one Set finer of Woof than Warp; from a 10 to a 15 Hundred, 2 Sets finer of Woof than Warp; from a 15 Hundred and upwards, 3 Sets finer of Woof than Warp; and sometimes, if your Woof does not answer your Expectation above a 20 Hundred, 4 Sets finer of Woof than Warp; and as this is the ordinary Way of Woofs, observe, first, whether the Weight of your Yarn for Warps, will bear such a

35

Fineness of Woof; for if there be but a little Disproportion of Weight, betwixt the Warp and Woof, that was designed for such a Hundred, you must put that warp Yarn in a coarser Reed, otherwife you have a thick Cloth by the Warp, but not by the Woof; for the Defign of finer-Woof than Warp is, to take as much Woof as may bring the Cloth as near a Square as possible: These must be regulated as the Market answers, the Goodness or Badness of the Flax, the hard twined, or soft twined Yarn, the Desire of the Owner, oc.

If it should be asked, What is the Reason that there is no fet Number of Cuts of Woof for one Ell of every Hundred? This would be a hard Question: Or such a certain Number of Spinels, Slips, and Cuts, for such a Number of Ells, as is set down in the Tables? I told you, that the Proportion of Woof was, or is, in the Dutch Method, as 6 Spinels Warp to 5 of Woof; but if they be finer of the Set, it will take 8 to 7, or 9 to 8, and from a 10 Hundred and downwards; if very fine of the Set, as much Woof as Warp, which makes a Square Cloth. None can propose to make Linen Cloth mathematically in every Inch, and in every Ell, to strike in fuch a certain Number of Threads, or as much Woof as Warp; this would be hard and difficult, yea impossible; the Dryness or Moistness of the Weather would be an Impediment, the Situation of the Shop, the Loom good or bad, the Dexterity or not of the Workman, the Goodness or Badness of the Flax, the Strength or Weakness of the Yarn, the Dreffing Stuff, &c. Every one that considers these Things, will plainly see that none can give a positive Number of Spinels, Slips, and Cuts, that any certain Number of Ells will take of Woof. This

This TABLE shews what Ounces and Drops is contained in the Fractions of Ounces, as $\frac{1}{4}$, or $\frac{1}{2}$, or $\frac{3}{4}$ of an Ounce.

W. 1	D. ,	D.

13 8	1	•
14	1	4
18	1 1	2

As every one will not so easily understand what Fractions of Ounces is in Drops, I have inserted this Table for the better understanding of the Weight:

— The first Column shews the Weight in Ounces and Fractions of Ounces; the opposite Columns shew what any of the said Fractions is in Drops: Suppose 3½ Ounces stands opposite to 3 Ounces and 8 Drops.

Example. What is $\frac{3}{4}$ of an Ounce?

Rule.

Multiply the Numerator 3 by 16, the Drops in one Ounce, and divide that Product by 4, the Denominator and the Quotient is 12 Drops, and so of the rest.

3 of an Ounce 4 48 | 12 Drops.

(37)

A TABLE shewing how many Yards, Quarters, and Nails, omitting Inches, will be given out of one Spinel of Yarn, from a 6 to a 25 Hundred inclusive.

N. B. That the first Column towards the left Hand, is the Hundreds of the Reed; and the next opposite Columns are the Yards, Quarters, and Nails, that one Spinel of true counted Yarn will make.

Example.

Suppose it was demanded, how many Yards, Quarters, and Nails, out of the Spinel, Warp and Woof, for a 16 Hundred; look for 16 Hundred in the Column of Hundreds, and opposite to 16 Hundred stands 2 Yards; and for 18 Hundred stands 1 Yard, 3 Quarters; and for 24 Hundred stands 1 Yard, 1 Quarter, and 1 Nail; and so of all the rest in this Table.

DIRE-

(38)

DIRECTIONS for the following TABLE.

TT is supposed thro' this Book, That when Hundreds is fet down upon the Top of each Table, it is not meant the Hundreds of the Reed, but the Hundreds of Warps, in such a Reed or Reeds; as the Cloth intended for Yard-wide when bleached, must be 40 Inches at Shot, so as to be 38 Inches from the Loom: And as some Reeds are made upon 40 Inches, some upon 421, and some upon 371 Inches; so it is always to be considered, that as many Hundreds and Porters of any of these Reeds must be filled, so as the Cloth may answer the common Breadths: And as the Dutch Reeds are much used; yet some have them not, this Table will shew what they measure on the Scots Ell, and so the easier calculate how much Warp you must have to make your Cloth answer the common Breadths. And so for any other Breadths, as Yard at Shot, for to stand 31 Quarters when bleached; and so of any Breadths whatfoever; always observing the same Fineness or Coarseness of Yarn, in the Tables of Weight, to give such a Number of Hundreds, and Porters of Warp, as to answer your desired Breadths.

39

A TABLE shewing what the Dutch Measures on the Scots Ell, from a 6 to a 25 Hundred, inclusive.

N. B. That the first Column towards the left Hand, is the Hundreds of the Reed, and the next opposite Column, is the Weight of Yarn per Hank that will be fit for any of the said Hundreds; and the last Column is the Weight that will be fit for Woofs, being from a 6 to 18 Hundred inclusive, about one Set finer of Woof than Warp, and from a 18 to a 25 Hundred inclusive, 2 Sets finer of Woof.

Example.

If each Slip of your Yarn that is designed for Warp, weighs 3 Ounces, then opposite to 3 Ounces for Warp, stands 15 Hundred, and in the Column of Wooss stands 23 Ounces, which will be the Fineness of Yarn that will woof a 15 Hundred; and so of the rest thro' this Table.

DIR E-

((4r;))

DIRECTIONS for Boiling and preparing of Yarn to be wrought into Cloth.

THE fooner the Yarn is boiled after spin.

the Saltness of the Spittle, when spinning, tenders

the Yarn very much.

2. The better that Yarn is cleanfed from its Filth, which is best done by Boiling; because altho' Yarn may be made white, yet not well purged, and consequently in the Bleaching, it must thin the Cloth much more than if the Yarn were well cleansed at first; because what Filth is not taken out in the preparing of the Yarn, must of Necessity cleanse in the Bleaching.

3. Now Yarn that is well and throughly purged

3. Now Yarn that is well and throughly purged from its Filth, before wrought into Cloth, must of Necessity stand the Trial of Bleaching better; because there is nothing left in the Yarn but the pure Stuff, and consequently it doth not thin so much in the Bleaching as ill prepared Yarn doth.

Of Boiling of Linen-Yarn.

A Ltho; a great many have attained to confiderable Improvement in Boiling of Yarn by the Help of Receipts printed and dispersed through the Country for that End, yet one Receipt more will not be amiss, as practised by the Dutch Weavers when in this Kingdom; and as there is a great many different Opinions in boiling of Yarn, such as

(42)

Leys made of Ashes, different Kinds of Ashes, steeping, sowring, grasing, &c. The Dutch do not steep; yet, in my Opinion, if Yarn is not made of soft silky Flax, steeping is necessary.

First of the Kinds and Quantity of Ashes.

The hard Wee-ashes that are burnt of Seaware, are sharpest and most penetrating, and some boil with the whole of these Ashes, without any Mixture of Pot-ashes amongst them; but as the hard Wee-ashes are of a hard Nature, a Mixture of soft Pot-ashes among them doth better, because they make the Yarn soft and more plyable than is it were boiled with the whole of the Wee-ashes.

Of the Quantity of Ashes.

For every two Pound of Yarn, one Pound of hard Ashes, when a Mixture of Pot-ashes is to be used with them; one Pound of the Pot-ashes, is double strong of the Wee-ashes, that is to fay, One Pound of Wee-ashes is to boil two Pound of Yarn, and one Pound of Pot-ashes is to boil 4 Pound of Yarn: Now then, the Quantity of Yarn that is to be boiled, is 64 Pound Weight, and then 32 Pound of hard Asbes would be sufficient; but for a Mixture of Pot-ashes, take for every 6 Pound of hard Ashes one Pound of fost, and then deduct so many of the hard Ashes as to have Part of the soft, that is to say, 24 Pound Weight of hard Ashes, and 4 Pound of Pot-ashes, will be sufficient for 64 Pound Weight of Yarn; and so observing an equal Proportion of a right Quantity of both Ashes for any Number of Spinels according to the Weight of the Yarn.

Loch, Rain, River Water is best, being softest; let the Water be as hot as ye cannot hold your Hand

43

Hand in it, then disolve the Pot-ashes, put in Ley of them in the Boiler, then stir in a Part of the hard Ashes, finely beat and searched, the Yarn being tied up according to the Coarseness or Fineness; if fine, tied up in two Spinel Bundles, if coarse, tied up in one Spinel Bundles (some link 2 Chain of the whole, but Tying is better, because it may press too hard together in the Boiler, and so spot the Yarn, as the Water doth not penetrate through the Links) then lay in a Row of the Bundles, and let it fink of its own Accord, straw in some more of the hard Ashes, then another Row of Yarn, and Ashes, till all be in; if the Yarn is well covered with the Ley it is enough; for too much Water makes the Ley weak: If coarle Yarn boil foftly 3 Hours, if middling Yarn 21 Hours, if very fine 2 Hours, or one Hour and an Half, keep it under the Ley for the Air-dying of the Yarn. After it is enough, take it carefully out of the Boiler for breaking, put it immediately in running Water, and if ye have not that Conveniency, put it into cold Water standing by for the Air-dying of it, open it out, and rinse it as quickly as possible, wring, shake every Slip very well, for slicking together, hang it up to dry, still shaking once a Day, or more, as it dries, and if it dries very fast, shake it oftner; if the Yarn is hard and stubborn, grasing will help, and for them who have not Conveniency of Grass, beating, rubbing, &c. will contribute to make it foft.
