MDCCLXXXIV.

# PREFACE.

AVING been led, through curiolity, to view the rude magnificence of the Highlands of Scotland, my attention was foon attracted by the less pleasing scenes of human misery in all its shapes; unalleviated by the cheering rays of hope, or any of the comforts, which the lower ranks of mankind, inhabiting richer soils, enjoy in a certain degree. Succeeding journies over the various districts of those mountainous wilds, served only to disclose fimilar distresses; and curiosity, the primary impulse, gave way to serious investigation. By hearing the complaints of those unhappy people; by comparing their various relations with each other, and with my own observations; I was enabled to ascertain those facts which form the ground-work of the following harrative.

A tract of land, that composes a fifth part of Great Britain, appeared, with some few exceptions, to be in a state of nature; a great body of people, and these the most virtuous in our island, dragging out a wretched existence, perishing through want, or forced by wild despair to abandon their country, their kindred, and friends, and to embark, moneyless and unknown, the indented slaves to unremitting toil and drudgery, in boundless deserts, at the distance of 3000 miles.

The result of these observations, was an enquiry whether the improvement of the country, and the relief of the people, were practicable; to what extent

thele

these objects could be carried; whether merely to soften local distress; or, in doing this humane duty, whether a permanent and valuable colony might not, at the same time, be established in those outskirts of Britain, to the great benefit, and security, of the centre. But, such was the disposition of the times, that it seemed a useless labour and expence, to introduce the subject on either side of the Tweed. Some sew lines, however, found their way to public observation, wherein the sidelity and bravery of the Highlanders were applauded, and the utility of permitting them to resume their savourite dress was warmly recommended.

Thus stood matters, when a train of events, the most unexpected and humiliating, contributed, in the operation and consequences, to exhibit, more than ever, the value of the Highlanders, and the importance of the country which gave them birth.

Emboldened by these considerations, and seeing no regular plan of policy proposed, relative to that country, I arranged, in 1782, the various memorandums which I had been collecting during a series of years; stated the distresses of the people, and the causes of these distresses; attempted the outlines of a plan whereby some inconveniencies would be removed, others mitigated, the country improved, the sisheries and nursery for seamen greatly extended; and resolved, in humble descrence, to lay the same before the public.

I have, throughout the whole, avoided all chimerical theories, and tirefome conjectures, founded merely upon report, or collected from the very erroreous representations of old writers. It was my wish to propose a plan, adapted, in all its parts, to the natural state of the country, the genius, qualifications, and relative situation of the inhabitants; practicable, expedient, and within the abilities of government.

These observations were printed in the Spring 1783; fince which time, some sheets have been privately circulated in both kingdoms, in the hope that gentlemen of rank or influence would lay the same before administration

ministration, as a stimulus to objects of greater importance to the strength and opulence of this island than is generally imagined. During a journey through part of Scotland in the Summer 1783, I was fully convinced that the calamitous situation of the Highlands had not been misrepresented in the narrative, and it was from the affecting relations of the people, that I drew up and annexed some particulars respecting the famine, which had not then fully subsided.

The SECOND PART, or APPENDIX, while it served to establish the foregoing propositions, assorded also an opportunity of introducing sundry remarks, which did not fall within the general heads of the pamphlet. The shores, seas, and lakes, of the Highlands had been fully described, because these are, or ought to be, the first object of public attention. Secondary to this national concern, is the improvement of the vallies; and a short topographical account of those tracts of sertility, in the manner of an itinerary, was deemed the most satisfactory mode of conveying information to the reader \*.

Many of the arguments, which had occurred in treating of the Highlands, feemed applicable to Scotland in general. This opened a new, and more extensive field of enquiry. If the revolt of some colonies, the conquest of others, and the then apparent danger of losing the remainder, gave those neglected wilds additional consequence, the improvement of the kingdom at large appeared equally expedient. The same idea admitted of being extended even to England itself, a country more indebted to nature, and the industry of individuals, than the attention or assistance of its government, as will evidently appear to any person who shall take the trouble of considering the matter in a general view.

\*The improveable parts of the Highlands and Western Isles are, as one to four of the whole, or one 20th part of Great Britain; containing collectively above 2500 square miles, or 1,600,000 square acres; being the dimensions of Middlesex, Surrey, and Kent united.

Thus the whole island seems to have been, in a greater or lesser degree, neglected, and its real interests facrificed to expensive schemes of conquest and empire, which, without effecting any valuable purpose, have brought it to the verge of ruin and bankruptcy.

There are, however, many persons, who, notwith-standing that the events, and consequences, of the late war, have disarranged the old delusive system of politics, and shown its inesticacy, still adhere to opinions, which cannot be desended on any principle of justice, humanity, or national expediency.

To such persons particularly I have, with greater zeal than abilities, addressed the following sketches relative to the ancient and present state of Great Britain, being fully convinced, that the objects of the greatest value to society may be obtained at less expence of treasure, and without involving the innocent multitude in the complicated, undescribable distresses of war.

Some of the tables, calculations, or estimates, are inserted from authentic documents; others, upon miscellaneous authorities; and some upon probable conjecture. Any errors that may have escaped notice, amidst so many sigures, will be corrected; the same attention will be given to any mistakes in opinion, so soon as they shall be discovered, or pointed out.

The writer must disclaim any pretensions to literary embellishments, grounding his hope of approbation, merely on the application, fatigues, and expence, which have been unavoidable through every stage and department of the business; and if any of the grievances, stated in these pages shall be redressed or mitigated, he also will derive additional satisfaction, in the feelings of his own breast.

April 1784.

INTRODUCTION.

TMMODERATE ambition, the love of empire. or the thirst of wealth, have most generally influenced the councils of nations, whether civilized, or in a state of rude barbarianism. To such ignoble motives, is owing that endless series of wars, devastations, and robberies, which, instead of giving stability to the conquering state, hath invariably hastened its fall. Of this truth, the history of mankind abounds in examples. All those potent empires which successively governed the ancient world, had their rife, their meridian, and their decline. By violence they acquired extensive dominion; the same means became necessary to maintain, or defend, that dominion; till at length, some neighbouring state, or combination of states, equally aspiring, subverted the whole fabric of power, which they transferred to themselves, which they for a while retained, and which they in their turn lost, together with their freedom, and their name. So complete hath been the extinction of those states, that, were it not for the Sacred, and some remains of prophane writings, corroborated, were it necessary, by inscriptions, medals, statues, and ruins of stupendous architecture, which have reached our times, we could have no conception that such mighty empires ever existed.

Our own island, though capable of supplying its inhabitants in all the real necessaries of life, besides a surples wherewith to carry on a beneficial traffic

with its neighbours, hath long been convulsed through the phrenzy of conquest, both within itself, and beyoud those limits which nature marked out as its proper boundary. As Britain is an epitome of the world, so are its annals, in all respects, similar to those of the great theatre by which it is environed.

No sooner had the successors of the Norman hero established themselves firmly on the throne of England, than they began to contemplate new schemes of conquest, whereby their dominions might be enlarged, and their power raifed above that of their

cotemporaries.

The object of those designs was nothing less than the fovereignty of France, Scotland, Ireland, and Wales: and it is fearcely in the power of language to convey a full idea of the calamities which those princes entailed upon mankind, through a fucceffion? of ages, in the profecution of their ambitious schemes: of aggrandisement. The burden of those wars fell particularly on Scotland, and the northern counties of England, owing to the obstinate resistance of the Scots; who, during a period of fixty years, not only defended their freedom with fingular bravery, but also carried the war into England itself, where they abundantly retaliated the violences which had defolated their country. The effects of those mutual inroads are still visible on the borders of both kingdoms; and it will require fome ages before cultivation, manufactures, and population, can be brought: to an equality with the interior parts.

In return for the continual drain of money, the waste of blood, and all the inconveniencies which a hostile nation must unavoidably sustain, both at home and abroad; England at the present period possesses nothing more than the fovereignty of the small. country of Wales, and the town of Berwick upon Tweed. Thus all the expensive armaments, and splendid victories of those warlike monarchs, whose names are mentioned with admiration by every Englishman, ferved only to impoverish their subjects, and desolate

their country, which was so greatly reduced by those exertions, that, had not the sea proved a barrier of defence, it must have become a province to the kingdom which it had long struggled to subject.

INTRODUCTION

But though the projects of the middle ages were barbarous in their object, calamitous in their operation, and delusive in the sequel; yet this nation, instead of reprobating the destructive measures of their ancestors, hath considerably improved upon them.

It was left to the æra of the Revolution to devise an engine, by which we might not only destroy, and be destroyed, upon the European continent: but also enabled to extend the calamities of war to every quarter of the world. Of all the inventions for the destruction of the human species, this hath proved the most effectual; neither can the most fertile imagination propose 'a method, whereby a commercial nation may, with greater expedition and facility, transfer its trade and manufactures, to its rivals in arts and arms. This device is called Funding; or in other words, anticipating the property of posterity, without conveying to that posterity any permanent equivalent, whereby it may discharge the burdens thus ungenerously entailed upon it, as will appear by the following retrospective view of events from the Revolution in 1688, to the present time.

Sketch of the British Politics and Wars from the Revolution to the year 1784, including the Origin and Progress of the national Debt-Dismemberment, and rapid Fall of the Empire-Perilous Situation of Government, and the Nation in general-War, the causes of our own distresses, and those which we have brought upon a confiderable part of mankind.

When William prince of Orange ascended the throne of these kingdoms in 1688, his cotemporary, Lewis XIV, at the head of a gallant nation, panting after military fame, was meditating the establishment of the French monarchy over Europe, a project

a 4

which

That war was carried on with various success dura ing eight years, when a general peace was concluded at Ryswick, without any material benefit to either of the contending parties; and England, at the death of king William in 1701, found itself involved in The first national debt, which amounted to the then unheard-of fum of 1. 16,000,000

Queen Anne refumed the war with redoubled vigour, wherein the allies, under the command of prince Eugene and the duke of Marlborough, gained many brilliant victories, but could not prevent Lewis from fixing his grandson upon the throne of Spain, which laid the foundation of the family alliance or compact, that still subfists, though faintly, between those kingdoms. On the other hand, the events of war put England in possession of Gibraltar and Minorca in the Mediterranean; and the French ceded Newfoundland and Hudson's Bay, in North America; also the sole possession of the island of St. Christopher's in the West Indies. The treaty of peace was concluded at Utrecht in 1713. And the national debt, foon after the death of the queen in 1714, had been increased, by the war, to the alarming fum of

Debt, at the commencement of the war in 1740, after a peace of twenty- \$46,000,000 feven years

>55,000,000

#### INTRODUCTION.

At that time, England again embarked in a war with Spain, on account of America; and, foon after, with France, in support of the queen of Hungary. Many battles were fought by sea and land, with various success; and in 1748 a peace was concluded at Aix-la-Chapelle, the basis of which was the restitution of all places taken during the war, by either of the parties, but which increased the debt of England -

Debt, at the end of the war in 1748 Reduced in 1755, after a peace of seven

78,000,000

75,000,000

32,000,000

Debt, at the commencement of the war

Before Great Britain had been able to reduce a tenth part of the debt occafioned by the preceding war, she was called upon, by her American colonies, to arm in their defence, against the encroachments of the French on the back settlements; and here we have the origin of the most extensive war, as Lord Chatham termed it, in which 71,000,000 England had ever been engaged. It

was also the most glorious to this country, both by land and sea, and put us in possession of Canada, and the two Floridas, in America; Grenada, St. Vincent, Dominica, and Tobago, in the West Indies; but involved us in

a fresh debt of Debt, at the end of the war in 1763 Reduced in 1775, after a peace of twelve years,

136,000,000

Debt, at Midsummer 1775

146,000,000 10,000,000

extremely humiliating to the dignity of the British name, fatal to her reputation, and injurious to her commerce. This was not all. The national debt, which, at the commencement of the war in 1775, was 136,000,000l. had increased at Midsummer 1783 to 257,000,000l. To this is to be added the deficiencies in fundry taxes; the arrear, in winding up the war, and other miscellaneous expences not yet fully known; but, when brought to account, and funded, will amount to several millions,

If this estimate be just, we shall perceive that the losing of America hath doubled the national debt; and consequently doubled the burdens of the people.

Total amount of debt (supposing the whole to be funded), which will be owing to the creditors of the public, at Midsummer 1784

The annual interest of ditto, including

the expense of management, will be nearly ditto per day 27,3971.

The peace establishment, including the civil list, above

To be raised by the public annually £. 15,000,000 ditto per day 41,0961.

Neat amount of the annual national revenue, arising from customs, excise, taxes, &c. copied from authentic records produced in the house of commons Jan. 1783, £. 12,000,279. Additional taxes June 1783, estimated at 560,000l.

Surplus of the annual expence, above the annual revenue, for which additional taxes must be levied, or savings appropriated \*

12,560,270

2,439,721

Pre-

The earl of Stair's estimate of the annual expenditure is still more alarming, viz.

£. 16,229,311 And in whatever quarter of the world they might, at any time, have been disposed to molest our trade, or at-

Unfortunately, these promising appearances have almost instantaneously vanished: a satal period, of seven years only, hath thrown us back above a century. Though the land tax be now unalterably established at four shillings or upwards, in the pound; though the revenue hath recently been augmented by a multiplicity of new taxes, some of them reaching the cabbin, and the garret; the industrious labourer, the widow, and the helpless; yet, with the aid of all these unprecedented exertions, the aggregate of the present revenue salls short, by more than two millions, of the annual expenditure consequently, the lands, the moveable property, and the commerce of this kingdom, stand mortgaged in the proportion of one sixth of what they now rise.

And he affirms, that the neat annual revenue of this country can never be brought for a permanency, and average of years, to exceed

12,000,000

Annual deficiencies, to be made good by new taxes, 4,229,311 The above estimate of the annual expenditure was made upon the supposition that the war lasted through the year 1783, which, sweled no other purpose than loading the nation with 25 additional proportionable increase of taxes.

xiii

Moreover, should any of the given branches of revenue fall short of the average annual estimates, such deficiencies must also be made good by extrataxation, or the public creditors must sustain a proportionable loss. It is a situation which admits of no other alternative, and is equally alarming to the proprietors of land, and the proprietors of stock. Their property depends, more or less, upon contingencies; on the elements, the seasons, the events of war, the integrity and abilities of those who shall be entrusted

with the management of public affairs.

Peace with all the world, and that for a long continuance, is therefore our only hope, and ought to be the ardent wish of every friend of his country, and of humanity. For almost a century past \*, England hath dazzled the eyes of mankind with the brilliancy of its campaigns in Flanders, and Genmany; in securing the Dutch barrier; supporting the houses of Austria, and Brandenburg. But though one hundred millions have been thus spent in continental wars and subsidies, neither the Dutch, nor the Germans, came forth, in defence of their benefactors, whom they saw engaged, in the unequal struggle, that dismembered the British empire.

Beyond the Atlantic, we shall perceive a still greater drain of English treasure. The money granted by parliament in bounties, towards encouraging the growth of American produce; the sums expended in support of the civil establishments of those colonies during their infant state; in defending them against the French and Indians; erecting forts, harbours, and other public works; have been raised by the subjects of these kingdoms only, while other nations now reap the fruits equally with ourselves, if not more so.

Upon the whole, we may fairly estimate our disbursements in establishing, protecting, and losing the

5 41

96

<sup>\*</sup> The years of peace fince the Revolution of war

Gibraltar, and Minorca, have been in our hands near eighty years, and we cannot value the peace establishment at less than half a million per annum.

In this estimate we include the military expence of for 7000 troops; stores; hire of transports; erecting new batteries, and otherwise strengthening the works? Consequently, the keeping and defending a barren rock, with an indifferent harbour; a poor, unprofitable island, with a good harbour, have cost near forty millions, since the years 1704—8, when they were and nexed to the British crown \*.

Recapitulation of money expended by Great Britain in foreign parts, fince the Revolution.

On German affairs . 100,000,000 -- American ditto • 260,000,000

Gibraltar and Minorca 40,000,000

£. 400,000,000 Being above £. 4,000,000 every year, and for which we possess no adequate consideration, no exclusive, permanent source of trade; but which, on the contrary, hath enhanced the price of manufactures, endangered our commercial intercourse with mankind, and deprived the nation of the comfortable, unmolested enjoyment of those gifts, which nature hath so liberally provided for all ranks and denominations of the inhabitants.

The fum total raised by Great Britain within the fame period exceeds f. 750,000,000; of which, above f. 220,000,000 have actually been paid for the

interest

interest of public debts; and, of this, a considerable part, supposed to be at present f. 1,000,000 annually, was drawn out of the kingdom by foreigners.

If, to the £.750,000,000 collected from the inhabitants by taxation and duties, we add the various in-conveniencies, interruptions, losses, and extra expences, sustained by the merchants, and the East-India Company; the manufacturers, and other individuals, during our late wars, the aggregate amount will not fall greatly short of £. 1000,000,000, within the space of ninety-six years, or f. 10,416,670 per annum. Such were the vast resources drawn from the natural produce of the island, the ingenuity, industry, and commerce of the people; and fuch also have been the impolitic obstructions and burdens laid upon that commerce, and those people.

Still more painful in the recital, is, the dreadful estimate of lives lost in battle, by shipwreck, and other accidents of war. Unhappily for the human species, the conflicts in which we engage, are not confined to France and England only. Whenever these rival kingdoms commence hostilities, they draw, into the destructive quarrel, a considerable portion of mankind, not only in Europe, but over a great part of the habitable world.

The favages of America, armed with their horrid instruments of death, march out with frantic rage, and frightful shrieks, eager, as their war fongs express it, to drink the blood of Englishmen, or Frenchmen, against whom they happen to be respectively led on, by either of the contending parties.

In the West Indies, the sugar islands are kept in continual alarm, subduing, and being subdued, alternately. Property is continually fluctuating; and the man who reckoned upon thousands to-day, sees himfelf a beggar on the morrow.

In Asia, the calamities occasioned by our national quarrels are still more complicated and distressing. Throughout the whole fouthern division of that immense country, every shore, every sea, and navigable

<sup>\*</sup> See a pamphlet, entitled "The Propriety of retaining Gibraltar" Impartially confidered."

The lives thus cut off, in various parts of the globe, fince the Revolution, cannot be fewer than a million of British subjects, and European allies, besides the Afiatic list, amounting to near four millions of industrious, inoffensive inhabitants, killed, or starved \*; and, if to these accounts we add the losses on the part of our rival, and her allies, we may fairly estimate the whole to be fix millions of people, who have fallen facrifices to war and famine, in all their horrible shapes, and for which these kingdoms are, in a great measure, responsible; for, it is a truth, which cannot be resuted, that to their unbounded thirst of power, dominion, and commercial establishments, hath been chiefly owing this waste of the human species, besides the calamities sustained by the survivors of these defolating scenes, abroad; while, at home, the train of distresses which war entails upon many individuals, and families, exceeds all conception; and, were their respective cases brought into view, it would fill the stoutest heart with horror. Deprived of husbands, parents, sons, or brothers; reduced, at the same time, from ease and affluence, to indigence, and all the mortifications of dependence, is the lot of thousands;

who, friendless, unnoticed, or despised, bewail in silence the loss of whatever was valuable, or endearing in the world.

Epidemical contagion, and the convulsions of nature, are calamities which we can neither foresee nor prevent; but the slames of war were kindled by ourselves; the ravages which they occasioned were our own ast and deed; nor doth it appear, that the events, even of the most fortunate wars, have reimbursed the nation, for a permanency, in any part of the expence and losses unavoidably sustained by those wars. Our consolation, on the contrary, generally consisted in the pitiful reslection, that our enemies were also maimed, exhausted, and almost reduced to bankruptcy. This hath been the winding up of all our wars; leaving us in the possession of no territory beyond our own island, which may not be wrested from us before the expiration of half a century.

Review of the Colonies and Settlements which still compose a part of the British empire, with an estimate of the exports and imports to, and from, England. Also, the exports and imports, to, and from, the revolted Colonies.

America. The British America consisted of two great divisions, the south, and the north; the former, luxuriant in soil and climate, populous, commercial, and flourishing; its produce wheat, to-bacco, rice, indigo, timber, flax, iron, pitch, tar, and lumber. This division contains 2,000,000 of inhabitants, who have formed themselves into 13 republics, independent of Great Britain, and of one another, now called The United States of America. The latter division, a cold, inhospitable, and thinly-inhabited country; its fields covered with deep snow, and its rivers froze up from November till April, which cuts off all social and commercial intercourse with Europe.

This

<sup>\*</sup> See an account of the famine in Bengal 1769, 70, as published throughout Europe by the Abbé Raynal. See also Dodsley's Annual Register, vol. XIV. page 205. And, for a general view of the British transactions in Bengal, fince it became a part of our empire, tee Burke's Speech, Dec. 1, 1783.

#### xviii INTRODUCTION.

This division was retained, by Great Britain, at the late peace. The habitable part joins the American States, and was originally in the poffession of the French, to whom it proved an expensive, unprofitable burden. It hath been no less so to Great Britain, but it is supposed to be very improveable. It is formed into two governments; those of Canada, and Nova Scotia. Canada is properly the native country of furs, peltry, and other articles which enter largely into the British manufactures. It also furnishes grain, timber, pot-ash, and hath valuable iron mines. This province, bounded on the north by frozen deferts, on the west by unknown countries, is only accessible to European shipping by the river St. Lawrence, whereon stand Quebec, Trois Rivieres, and Montreal.

Nova Scotia derives great importance from its local fituation, and its harbours, particularly Hallifax, Annapolis, and Port Roseway, the safest and most capacious in North America; the centre of northern navigation; a shelter to shipping from all parts of those seas, during the hurricanes, or when the other harbours are frozen up; and here also vessels of any burden may be repaired. In a political view, Nova Scotia is the most valuable of all the British settlements in the western hemisphere, because on this province depends, in a great measure, our possession of the fur trade, the Newsoundland sisheries, and the Sugar Islands.

The West Indies. By the West Indies is understood those innumerable islands which lie between the two continents of America, to which division of the globe they properly belong. They were discovered near 300 years ago by Christopher Columbus, in the service of Spain, and have since been shared, thro' force or treaty, by France, Great Britain, Denmark, and Holland. Of these islands, Great Britain possesses, Barbadoes, St. Kitt's, Antigua, St. Vincent, Dominica, the Grenades, and sone others of inferior importance;

#### INTRODUCTION.

portance; from whence we import fugar, rum, cotton, coffee, ginger, pepper, guaiacum, farsaparilla, machineel, mahogany, indigo, gums, and other valuable articles.

Coast of Africa. The southern coast of Africa was discovered by the Portuguese in that adventurous age which first carried the Europeans to the American world. Besides supplying the West Indies with slaves, it produces gold dust, ivory, gums, and other articles, far too valuable to be engrossed by the Portuguese alone: consequently the English, French, and Dutch, have taken a share of this commerce also. Each nation hath its respective forts at the entrances of the principal rivers, but the unhealthiness of the climate prevents the establishment of colonies.

East Indies. The Portuguese gradually extended their discoveries along the coast of Africa, till at length they arrived at the most southern promontory of that quarter of the globe, which, in their joy, they called The Cape of Good Hope.

This discovery opened, unexpectedly, a new tract to the Eastern shores of Africa; to Persia, Arabia, the Mogul empire, China, Japan, and the numerous Spice Islands of the Indian seas. Here the Portuguese erected a commercial empire at the expence of the unhappy natives, on whom they practised all the frauds, violences, and outrage, which their Christian brethren of Spain were carrying on, with unrelenting barbarity, in the western world.

The great wealth which the Portuguese brought into Europe, while they enjoyed the monopoly of the Indian commerce; the report of their civil and religious tyrannies; the impatience of the natives to throw off the intolerable yoke, began to engage the attention of other European states, particularly the Dutch, who, with the assistance of the natives, expelled the oppressors of India from almost every settlement, which the Dutch seized for themselves, and thus established a new, and more permanent power, because founded on justice and moderation, towards the people over whom they preside.

D 2

The

The Mogul empire, or Indostan, extends, in a compact square mass of country, from the Tartarian mountains in north latitude 36, to the Bay of Bengal, latitude 22. From thence it stretches due south, in the form of a peninsula, to Cape Comorin, within 8 degrees of the line, and thus enjoys a coast of 3000 miles, which, besides the benefits to trade and navigation, contributes to the health of the Europeans who choose to reside in those very distant regions.

Indostan, in its most extensive sense, contains 1,116,000 square miles, and is consequently equal in size to Great Britain, Ireland, France, Spain, Portugal, Italy, Germany, Hungary, Poland, and Turkey in Europe. The number of people who inhabit Indostan is computed at 100,000,000 of Indians, and 10,000,000 of Mahometans or Moors, the descendants of those Arabs, Persians, and Tartars, who at various periods over-run and subdued this unwieldy empire.

The native Indians are zealously attached to their religious tenets, their laws, and antient customs; ingenious, tractable, inossensive, and submissive to a degree unknown in Europe; dark in their complexion, especially towards the south; feeble in their persons, constitutionally and religiously temperate, living chiefly upon rice, vegetables, and water.

Indostan is not only one of the largest empires in the world, but its produce is the most valuable; being the greatest repository of diamonds hitherto discovered; besides its spices, drugs, colours, silk, cotton, saltpetre of the best quality, sasfron, cossee, sugar, and rice. Its manufactures in silks, embroidery, and cottons, have long been the admiration of Europe, and particularly England, where the thirst of revenue permits the importation of these foreign manufactures, though now equalled, if not exceeded, in beauty, by those at home.

Between the years 1751 and 1760 a train of events. more fortunate than honourable, put the English East India Company in possession of those provinces which have hitherto been confidered as the garden of Indostan, viz. Bengal, Bahar, and part of Orissa; the whole, collectively, equal in dimensions to the kingdom of France, abounding in manufacturing cities, inhabited by 10,000,000 of people, and producing a revenue of 3,500,000l. annually. The fertile province of Benares, otherwife Gazipour, adjoining to Bengal on the north, and producing a revenue of 260,000l. was in 1774 annexed to the Company's possessions in that quarter. The provinces of Bengal and Benares lie on both fides of the Ganges, and are every where watered by its tributary streams, which are navigable for veffels of 200 tons, and connected by canals of sufficient depth for all the purposes of extensive inland navigation. The company also posfess a district of 40 miles round Madrass; the island of Bombay; and feveral detached cities upon the Indian shores.

By means of these advantages, and their territorial revenues, the Company enjoy, almost exclusively, the whole commerce of the Mogul empire; with the southern parts of Arabia, Persia, and Tibet. They trade also with the kingdoms of Asem, Aracan, Ava, Pegu, Siam, Cambodia, Malacca, the empire of China, and all the Oriental islands, excepting Japan, the Manillas, and the islands possessed by the Dutch.

Such are the various and disjointed branches of the British empire; abounding in articles whereon mankind set the greatest value; a stimulus to invasion, and which will ever require a considerable expence to maintain.

#### INTRODUCTION.

Balance against exports f. 1,651,814

Could we ascertain the value of supplies for garrisons, particularly in Africa, the balance against exports would exceed 2,000,000l. But of the articles which swell the amount of imports, we circulate a confiderable quantity over Europe, chiefly for specie.

Estimate of English exports and imports to, and from, the revolted colonies, upon periodical averages of ten years from 1700 to 1780.

			Exports.		Imports.		nce infavour Exports.

f. 200,000 per annum should be added to the exports, being the value of flaves imported into these provinces by the British merchants directly from

#### INTRODUCTION.

Africa. This included, Lord Sheffield states the total amount of balances in favour of England between 1700 and 1773, at f. 20,000,000 From which may be deducted the esti-

mate of supplies for the army and navy, the same being valued in the exports

10,000,000

f. 10,000,000

Against this balance, and all the commercial benefits which England derived from North America, previous to the revolt of the Thirteen States, Lord Sheffield, and other writers, have brought forward the following ponderous fums advanced by this country;

To the annual civil establishments of the provinces, previous to the war in 1755 — £. 70,000 To ditto from the peace of 1763 to the 370,000 time of the stamp act

To the high bounties granted by parliament to encourage American produce, as hemp, flax, fir, and pine timber, pitch, tar, turpentine, indigo, &c. sup-£. 200,000 posed in the whole to be annually,

To commercial indulgences allowed the provinces

at the expence of the British merchants.

To loss sustained by those merchants from bad payments, particularly fince the year 1775, when America owed feveral millions

But these considerations, however important, are trifling to the expence of the three last wars, which Lord Sheffield places to the account of America, and estimates as follows, viz:

The war commencing in 1739	-	£. 31,000,000
1755		71,000,000
1775	<b>-</b>	100,000,000

£. 202,000,000

The expence of the last war seems to be underrated by feveral millions.

#### xxiv INTRODUCTION.

Relative situation of Great Britain and France, in climate, soil, extent of territory, commerce, revenue, and other particulars.—INTERNAL IMPROVEMENTS recommended, as affording new sources of strength and revenue, whereby the mother country will be enabled to retain its settlements, extend and protest its commerce.

The island of Great Britain is situated between the 50 and 59 degree of latitude, a climate which qualifies the inhabitants equally for the arts of peace or war; while the breezes from the surrounding ocean soften the rigours of winter, and temperate the air to a degree unknown in countries upon the continent, lying under the same latitudes.

It is equally happy in its animal and vegetable productions; its metals, minerals, and fisheries; forming, upon the whole, a great storehouse or magazine of those articles which are the most serviceable to the real wants of mankind. The returns arising from the exportation of these in favourable years, exceed credibility, and they admit of being further extended, particularly those of grain, and the sisheries.

This natural produce, however valuable in itself, both for home manufactures and exportation, is rendered still more so, from the oblong form, and insular situation of Great Britain, possessing a coast of 2000 miles indented on every side by lakes, bays, or harbours; communicating outwardly with the ocean; internally, with numerous navigable rivers and canals; by which means all the trading towns are ports, which communicate with each other, and with the four quarters of the world. The manufacturers at Leeds, Manchester, Birmingham, and other places, ship their goods almost at their own doors, at a low expence of inland carriage to the purchasers; and receive back,

\* England is fertilized by more than 50 rivers, which are navigable for barges, carrying from 5 to 150 tons. Scotland hath only 3 navigable rivers, viz. the Clyde, navigable as high as Glafgow; the Forth, at Stilling; and the Tay, at Perth; but nature hath made ample amends to that kingdom in the numerous lakes which penetrate from 5 to 40 miles within land, and are navigable for thips of the line,

by the same easy conveyance, the raw materials of both hemispheres. These are advantages of the most effential importance to a commercial country, and which no continent, or widely extended mass of land, can obtain so completely.

These kingdoms are also happily placed between the two great divisions of the globe; having Europe, Africa, Asia, and the valuable Oriental islands, on one side; North and South America, with the West Indies, on the other. By this most favourable position, in the centre of the world \*, they carry on an expeditious intercourse with commercial nations; their ships are continually steering through the ocean in every direction, and the whole earth is their market. Thus hath nature towards this island been lavish in favours, which surrounding nations may admire, but cannot attain. She hath pointed out, beyond a possibility of misconception, that the part assigned to Britain on the great theatre of the world, is an invariable attention to arts, commerce, fisheries, and navigation.

Nature is, however, so diversified, that though, in fundry respects, Britain enjoys a decided superiority amongst nations, yet this pleasing reflection receives a check in the review of our comparative situation with France, the only European state that hath any pretensions to rivalship, or from which danger is to be apprehended.

#### xxvi INTRODUCTION.

The fuperiority of that kingdom in climate and foil, is still more considerable. The northern provinces, as Picardy, Normandy, Britanny, Lorrain, and French Flanders, equal the most fertile counties of England, in grain, and common fruits. But the natural riches of France, are its southern provinces, between which, and England, all comparison ceases.

To explain this feeming improbability, it may be necessary to remind the reader, that those provinces supply Europe and America with the most delicious wines, as claret, burgundy, champaign, pontac, frontiniac, muscadel. They also produce in great abundance, brandy, honey, the finer fruits, silk, saltpetre, sassfron, and excellent salt; articles, which enter deeply into the commerce of France, and furnish exports, sufficient of themselves to enrich a great kingdom.

Such extent of dominion, and luxuriancy of foil, imply a numerous population, which, according to the late returns of the intendants of the provinces, amounts to near \_\_\_\_\_\_ 28,000,000

Specie

#### INTRODUCTION.

xxvii

Specie in France — £. 87,000,000 ———— Great Britain and Ireland 20,000,000

In favour of France — 67,000,000

The revenue and expenditure of France have been gradually increasing since the reign of Lewis XIV. and they amount at present to 18,000,000l. This sum may sound high to an Englishman; but, was France taxed proportionably to Great Britain, its revenues would probably exceed 24,000,000l.

This conjecture is founded upon the comparative population of both kingdoms. If 5,000,000 of people in England, raise near 15,000,000l. a country still more fertile, equally commercial, and inhabited by 28,000,000 of people, could extend its revenue beyond the abilities of any two nations in Europe to equal.

The great superiority which France enjoys, from extent of territory, and fertility of soil, derives additional value from her local and maritime situation. Washed on one side by the Atlantic, she trades with the northern parts of Europe, the coast of Africa, India, China, and America. Having the Mediterranean on the south, she engrosses almost the whole trade of Italy, the States of Barbary, the Turkish empire in Europe and Asia, comprehending Greece, Constantinople, Syria, Egypt, and other parts of those extensive shores, which antiently engrossed the commerce of the world \*.

Next, if not superior, to those channels of commerce, are her West India colonies, which far exceed, in extent, and value, those of Great Britain; and new plantations are in continual progression. The annual produce of the European colonies was thus valued some years ago, when the island of Tobago was in the hands of the English; viz.

French

<sup>\*</sup> The British trade with those countries was formerly very considerable and beneficial; but it is at present little more than a name, owing to the rivalship of the French, particularly in broad cloth, which they manufacture chiefly of smuggled wool from Ireland and this kingdom.

It would be endless to enumerate the various channels of commerce and revenue which that potent, active kingdom hath opened, and is opening; some of them, at the expence of Great Britain, in defiance of our ships of the line, and all the vigorous efforts we

have been making to retain them.

Equally attentive is that nation to objects of inferior concern, but which, in the aggregate, are rendered subservient to the great plan of national polity. It is well known that Greece and Rome fet examples to mankind in whatever is beautiful, stupendous, and useful in architecture and science. In imitation of those great models, the public works in France are constructed with a spirit, taste, and solidity, far surpassing the diminutive, imperfect undertakings in England; because, in the former country, they are the works of government, conducted on the most extenfive plans, with a view to magnificence as well as general utility. Whereas, in England, those works which are of the greatest national importance, as highways, canals, and harbours, are entrusted solely to the abilities of a few traders, or country gentlemen, whose only views being profit, or local conveency, they are executed upon contracted defigns, frequently with borrowed money, and consequently subject to such heavy burdens as to defeat, in some respects, the ends for which they were undertaken.

Equally liberal, magnanimous, and politic, is the French government, in adapting its regulations in finance, to the particular fituations, cases, and abilities of the respective provinces which compose the king-

INTRODUCTION.

XXIX

dom. The duty upon falt, for instance, is levied in some districts extremely high; in others, considerably lower; while the poorer countries are totally exempted. Even the frontier provinces, which that kingdom hath been gradually absorbing by conquest or treaty, are indulged with privileges and exemptions, which the native French do not enjoy. This condescension cannot fail of gaining the affections and considence of those remote subjects, and of facilitating new acquisitions.

Such is the nation which Britain hath as its rival in arts, commerce, and arms. Superior in climate, fertility, and dominion; in population, revenue, specie, muniscence, and civil polity; availing itself of the errors of this country, and rising upon its fall.

Upon the whole, we have been too fecure in our estimation of that kingdom, and the wisdom of its councils. Instead of a rival, there is reason to dread a superior, or a controlling power, in every quarter of the globe. We have lately beheld our widely dispersed, and devoted empire; our commerce, shipping, and all the avenues and fources of external revenue, at the mercy of the most potent kingdom on the globe; whose friendship is universally courted by mankind, and whose influence gives the turn, or cast, to the councils of Europe, Asia, and America. No longer governed by an oftentatious display of military parade in Flanders and Germany, our rival now directs her attention to commerce, the navy, and the humbling of Great Britain. While we are amusing ourselves with the unceasing squabbles of ambition, faction, or party, France is concluding a treaty, or meditating a blow against this infatuated country. Our wars, therefore, are in future to be considered, not as wars of choice, but of unavoidable necessity. To whatever hemifphere France directs her fleets and armies, thither the British armaments must follow, to watch so vigilant an enemy, and to ward off the impending danger.

Thus, there remains no alternative between a total relinquishment of our transmarine possessions, or a

#### INTRODUCTION.

continued, expensive preparation for defensive war. If we resolve upon the latter, we must at the same time devise new sources of men and revenue, a matter of greater difficulty than some speculative writers feem to allow. The ordinary and extraordinary revenues have nearly feen their utmost limits, beyond which they cannot be carried, without endangering manufactures and population. Neither can we extend the lines of our narrow kingdom, because these are fixed, unalterably, by the hand of Nature. But though we cannot enlarge its boundaries, we may improve its foil, realize millions of acres which are covered at present with heath, brushwood, moss, or stagnated waters. We may encourage arts, and new branches of manufacture; facilitate inland carriage, extend the fisheries, and raise a new world of thriving populous villages. The hitherto neglected metropolis may be improved, and ornamented with magnificent edifices, fo as to become the admiration of mankind, and to draw hither the wealthy, and the curious, from all parts of Europe, as to the centre of arts, commerce, and splendour.

Harbours may be deepened, royal dock-yards constructed in the most eligible situations, and ship-build-

ing encouraged around the whole island.

We may adopt a compendious and faving mode of collecting the revenue, to the mutual advantage of government and the community; besides the suppresfion of that national evil, fmuggling; a practice, which the vigilance of the whole navy of England would in vain attempt to prevent. We may appropriate a given fum for reducing the national debt; or adopt for that purpose some of the plans proposed by doctor Price, whose writings on this subject ought to be read by all those who have any regard for the safety of their country, its commerce, and dependencies.

These seem to be some of the most necessary objects of attention; but, if improvements were extended to a revifal of the whole system of national polity, so as to model, qualify, and bring down all the constitu-

ent parts, to cases and circumstances now existing: the objects will be found fo numerous and important, that it would require the abilities, and political knowledge, of a Sheffield, an Eden, or a Tucker, to

bring them into public view.

With this island is lodged the active, invigorating force, that gives, or ought to give, fecurity and protection to all the distant branches throughout the wide expanse of empire. Proportioned, therefore, to the magnitude of external dominion and commerce, should be the powers of the centre; a consideration which hath not, feemingly, had a due share of attention. The improvement of the mother country was neglected, as an object of trivial concern, and the consequences were such as might have been expected. Filled with vast ideas of extensive empire, and commercial monopoly, we enjoyed a momentary fplendour, at an expence far exceeding our abilities, and in a few years the golden dream vanished.

But so extensive were our distant possessions, that though an empire be lost, through the weakness of the feat of government, an empire still acknowledges our fway; whose proportionable magnitude, to that of Great Britain, is as five to one, without including the uninhabited regions of Labrador, and the countries

round Hudson's Bay.

Considering our fituation, therefore, in every point of view, national improvements, and the increase of population, feem not only matters of expediency, but of positive necessity; objects of the first importance, and to which all other concerns are only fecondary, in a very distant degree. Happily, the field which yet remains for the exercise of a patriotic administration; the internal resources still in reserve for the relief of an oppressed kingdom; afford a pleasing, well-grounded prospect, that we shall not only be able to surmount prefent difficulties, but even to rife, with redoubled strength, from the ruins of a shattered empire. If we wish to crect the fabric of future prosperity on a permanent basis, we must return to our deserted native country;

trace out the unexplored gifts of nature, and bring into action all its hidden treasures. England in 1784, contrasted with England at the Revolution; with Ireland, Russia, and North America, is a highly improved country. But England in 1784, compared with Holland, China, antient Greece, Italy, and Egypt, is yet in a state of nature; still more so, is the northern part of our island, as will appear in the sub-

fequent review of that kingdom.

Respecting population, we have to observe that the feven United Provinces of the Netherlands, containing only 9540 fquare miles, and supplied in grain and necessaries by their neighbours, calculate the number of inhabitants at above 2,000,000. Whereas Great Britain, which contains 77,244 square miles, and supplies other nations with its exuberance, whose natural fituation is most eminently calculated for inland and foreign trade, is supposed to be inhabited by no more than 6,300,000. We may therefore, without entering upon minute calculation, thus estimate the number of people, who, with the aid of government, might be maintained and employed in Great Britain, viz. In England 12,000,000 3,000,000 - Scotland

15,000,000

If the Irish government shall persevere in its patriotic efforts, the population of that fertile kingdom may be increased from 2 to

5,000,000

20,000,000

the whole constituting a power sufficient for all the purposes of external defence, against the united force of our very formidable rival, and her numerous allies.

To these favourable circumstances on the creditor fide of public affairs, we have further to add, that, after 1791, the remaining long annuities, and life-annuities, granted in the reigns of King William and Queen Anne, also the annuities given as douceurs

### INTRODUCTION.

to those who have advanced money to the state. fince those reigns, will gradually expire, by which above 1,300,000l. annually, will revert to the public.

It is ever to be regretted that government did not raise the loans, or the greatest part of them, on temporary annuities, which they might have done at a trifling difference in the expence. If, instead of 10,000,000l. the interest of the present debt, and of which eight parts are, or will be, perpetual, government had funded a tenth part only in perpetuity, the expence would fearcely have been felt by the nation in general, while a million paid annually to the opulent creditors of the public, would have fully answered all the purposes of individual conveniency. Such would have been the happy state of our finances at the present time, and so light the burdens transmitted to posterity, had ministers been seriously inclined to keep the public debts within moderate bounds. Nor is it yet too late to put these enormous burdens into a train of redemption, within a given time, providing that our present rulers shall be so disposed. If they wish to gain the full confidence of the nation; to unfetter our commerce and manufactures; to check emigration; and to keep that many-headed monster, war, at a distance, by being always prepared for it; if they are emulous of honest, well-earned fame, and desirous to transmit their names to posterity, as the saviours of their country; they will listen to the voice of reason, and the calls of common justice towards an injured community, who have been wantonly, and grievously loaded, beyond any example in the annals of mankind.

The further resources still in reserve for national purposes, may be thus stated.

Savings in the army and ordnance establishments, in consequence of the loss of America, and the very expensive, though useless island of Minorca.

Ditto, in bounties on American produce, and other disbursements in those states, the whole supposed to be half a million annually.

#### INTRODUCTION.

Ditto, in collecting the excise, customs, and duties, being at present from 6 to 15 per cent. on the gross amount, but which may be reduced to less than one half of that expence, so soon as the complicated mass of revenue shall be simplified or consolidated, and imuggling suppressed.

Ditto, by abolishing the bounty on the exportation of corn, supposed to cost the nation 140,000l. annually, upon an average of years, without answering any other purpose than the encouragement of frauds. it being alledged that many cargoes thus shipped upon a bounty are, foon after, brought back, relanded, and shipped upon a second bounty \*.

\* A bounty upon the exportation of corn in a manufacturing country, is fo far impolitic, as it affords a pretence for raifing the rents of lands at the expence of that class of people who are least able to bear it; and, at the same time, gives our rivals in trade a decided advantage at foreign markets. It hath been argued, in support of the bounty, that cheap provisions is the source of idleness, and disorderly habits, amongst persons who are restless through the impatience of money in their pockets. Admitting this to be the case with a portion of the mechanics, labourers, and other working people throughout the kingdom, shall the wives and children of these thoughtless men be rendered still more wretched. through the want of that necessary article, bread, thus artificially enhanced beyond its natural value, and beyond the abilities even of the most industrious mother to purchase a sufficient quantity for her unhappy offspring? Or, because the kingdom may contain 50 or 60,000 diforderly persons, is the whole body of the fober, the domestic, and the industrious manufacturers, artists, and labourers, with their families, amounting to fome millions, to be thus deprived of the gifts which Heaven hath fo bountifully provided for them.

It hath been further argued, that, as wages are higher in England than in any other country, the working people can bear a proportionable rife in the price of provisions; but it strould be considered, that human nature is subject to accidents, to lingering sickness, and to death; that even the most diligent are sometimes out of employ, from stagnation of business; and that when the work, from whatever cause, is at a stand, the supplies of a whole family are instantly cut off. Debts, or the precarious dependence upon friends or neighbours, look them in the face, and the loss of one week throws them back many weeks. It ought also to be considered, that as taxes, and all the necessaries of life have risen, and are rifing, far beyond any example in other countries, the article of bread, should, in policy and humanity, be permitted to reach the cottage, and the garrer, at such prices as bounteous nature alone, shall, from year to year, stamp upon it.

Sale

#### INTRODUCTION.

Sale of the royal forests, crown lands, and other unproductive claims, which would also open a new field to agriculture, population, and the confumption of home manufactures.

Some of these savings are now in actual progression. and the accumulated amount of the whole will ulti-

mately exceed 2,000,000l. annually.

In the mean time, however, additional taxes must be levied to raise the public revenue to a par, or level, with the unavoidable disbursements as before stated; and, as perfons of all denominations have fomething to fay on these subjects, the following observations are submitted, among other schemes of the day, to the consideration of the reader.

The objects of revenue may be classed under three

general heads;

1. The landed property; on which, owing to late improvements, and the rapid growth of towns, the

tax is levied at present, very unequally.

1. Trade and commerce; or duties and excises on exports and imports, manufactures, and the necessiaries of life. Objects, that ought to be the last in consideration, and always touched with the greatest delicacy; but which, on the contrary, have been taxed, and re-taxed, to an alarming degree; tending to sap the foundations of commerce, the great prop on which all other fources of revenue chiefly depend.

3. Luxuries, superfluities, ond amusements, seem therefore, the most eligible objects of taxation, and which will be more or less productive in proportion as commerce shall be exempted. From these channels all the deficiencies of revenue may be amply supplied, and at an eafy expence in collecting; without oppressing any class of people; without cramping the national exertions; or driving the industrious manufacturers and their families to the new world. The articles which feem to be the most productive, though the least burdensome, are,

These taxes, if duly enforced, are calculated to raise near 2,000,0001; a sum which, with savings, and the extinction of temporary annuities, would effect the following effential purposes, viz:

Make good all the deficiencies of revenue, arising

from whatever cause.

Enable government to reduce the national debt, by means of an accumulating fund, upon compound interest, during a given number of years\*. And thirdly, enable

\* Dr. Price and other gentlemen conversant in numerical calculations, have given several striking examples of the progressive effects of accumulating interest, providing that both principal and interest shall be permitted to operate, without alienating any part thereof, as was originally proposed by the projectors of the finking fund in

first slowly. But, the rate of interest being continually accelerated, it becomes in some time so rapid as to mock all the powers of the

### INTRODUCTION. xxxvii

enable government to appropriate a specific sum annually to objects of national improvement; which, besides giving encouragement to ingenuity, and employment to the industrious, would promote the circulation of specie throughout the kingdom, increase the demand for various articles of inland manufacture, keep the people at home; and finally, produce, in their operation, an annual equivalent equal to the whole amount of the original expence, if not, in many instances, exceeding it.

So foon as the great concerns of the nation shall be put into this happy train, Britannia may be confidered as out of danger, and in a hopeful way; especially so, if we, instead of stimulating the jealousy, and irritating the passions of mankind, enjoy our superlative advantages, in humble gratitude to the Author of those gifts, and wish moderation and humanity towards mankind, of whatever country or complexion.

This rule of conduct will allay the jealousies, dissipate the resentments, and secure the friendship of an

imagination. One penny, put out at our Saviour's birth to 5 per cent. compound interest, would, before this time, have increased to a greater sum, than would be contained in a bundred and fifty millions of earths all folid gold. But if put out on simple interest, it would in the same time, have amounted to no more than seven shillings and four pence half-penny.

Respecting the present national debt, the Dr. says, that a million borrowed annually for 20 years, will pay off, in this time 55 millions 3 per cent stock, if discharged at 601 in money for every 1001. stock; and in 40 years more, without any surther aid from loans, 333 millions (that is 388 millions in all) would be paid off. The addition of 19 years to this period would pay off a thousand millions.

"One million yearly applied to discharge our debt, would, says Baron Maseres, raise in 60 years, at 75 per cent. 317 millions."

Such is the hope yet remaining for this island, after the long train of political errors which characterize the age. It must therefore afford every friend of his country, and of posterity, very considerable satisfaction when he contemplates, that by a slight requisition on a few articles of luxury only, our incumbrances may be discharged, and all taxes on manufactures, and the necessaries of lite abolished. By this happy turn in our affairs we shall, consequently, go to foreign markets with better goods, and at lower prices; nor will there be, under such circumstances, the smallest pretence to tansact the globe, in quest of remote settlements.

Such is the arduous work allotted for those who are, or shall be, entrusted with the management of public affairs. They have to undo the mistakes of almost a century, and to lead the nation into that direction which nature, experience, and the circumstances of the times, point out as its proper line of action.

the other.

The embarraffments to be encountered, and the difficulties to be surmounted, in restoring a fallen empire, present a noble field for the exercise of Roman patriotism; that species of virtue which elevates the mind, supersedes all selfish or frivolous considerations, and perseveres, with enthusiastic zeal, in whatever is great, useful, and benevolent. It is pleasing to observe, that as our former system was fallacious in its principle, and ruinous in its operation to ourfelves, and to mankind; the measures reserved for the present day will produce the most salutary, healing, and beneficial effects, wherever our influence. extends. That plan of action, which is calculated to bestow not imaginary, but real glory, to this exhausted country, will, at the same time, give peace, security, and comfort, to a tenth part of the human race \*.

\* The world is supposed to contain 953 millions of people; of which number, 25 millions are under the sovereignty of the king of Great Britain; but, in estimating the whole collective body of mankind who are more or less under the influence of the British councils, or affected by them, we must include the greatest part of the Mogul empire. The trust which Heaven hath reposed in the members of the British senate is, therefore, a matter of the greatest importance, and most serious concern: they are the stewards of nations and people, in every quarter of the globe; bound, by every possible tie, to diffuse universal justice, and essectually to redress the grievances of those who cannot, or who dare not, lodge their complaints personally, where alone the supreme power is vested.

( xxxix )

ANTIENT AND PRESENT STATE

# SCOTLAND;

PARTICULARLY THE

### LOW COUNTRIES.

Commercial Annals of Scotland:

COTLAND having been long harraffed by hostile invasion, and sometimes embroiled in civil commotions, the profession of arms became both a necessary, and a favourite employment amongst the great body of the people. Every man was a foldier, ready to march at the command of his chieftain, or upon the summons of his prince. The nation, thus inured to the habits of war, in defence of their country and liberties, and always prevailing in the sequel, gained a military reputation abroad; while the valour and fidelity of the auxiliary Scots, in the armies of contending princes, procured their native kingdom various commercial privileges and exemptions, which it enjoyed until the accession of James VI. to the crown of England, when those nations, the mart at Campvere in Holland excepted, alledging that Scotland was no longer a separate kingdom, subjected its commerce to the fame regulations and restrictions as that of England. The Scots of the middle ages, sensible of the benefits to commerce which those distinguished privileges bestowed, began to avail themselves of the riches which their seas and extensive

coasts afforded, and to import, chiefly by means of the fisheries, not only the produce of more luxuriant elimates, but also specie in considerable plenty; insomuch, that the coin of Scotland continued, for many ages, the same in quality and quantity as coins of the like denominations in England.

Mention is made by foreign writers of a traffic between Scotland and the Low Countries, whither, in the ninth century, the Scots carried their fish; and it is observable, that this trade first suggested to the Dutch the idea of that fishery on the coast of Scotland, which was the origin of their rise, from infignificant villages, to High and-Mighty States.

Long before that period, however, the Scots and Picts feem to have been acquainted with certain principles of rude architecture, as appears by fundry houses and ruins, particularly in the Highlands, of a most singular construction, and fully described by the antiquaries of the present century.

Next in time, are the circular towers at Brechin and Abernethy, which have also been described, tho their uses have not been ascertained, by those writers.

It is beyond a doubt that ecclefiastical buildings of considerable magnitude began to be erected in the fifth century; some of these buildings being mentioned by Bede who lived near that period, and by succeeding historians, and charters.

But it was not till the Scots had re-united the Pictish kingdom, expelled the Saxons, broke the power of the Danes, and established peace and security, that the princes, nobility, and dignified clergy, began, by means of commerce and the sisheries, to erect those magnificent fabrics which characterize the 11th, 12th, and 13th centuries. Those mighty works were carried on with unremitting assiduity, under the patronage of a line of excellent monarchs, through whose mild government, wise institutions, and patriotic exertions, the kingdom arrived, comparatively, to a considerable degree of resinement, and began to form a part in the political scale of Europe, when the death of Alexander.

der III. in 1285, wound up that flourishing period, and embroiled the two British kingdoms in all the calamities of a fixty years war.

(xli)

The population, the commerce, and the refources of Scotland, at the commencement of that destructive æra, must have been very considerable. The kingdom was supplied in grain, arms, and other necessaries, from Venice, Genoa, France, and the Low Countries; and, as all the trisling manufactures of that age must have been at a stand during the war, we may attribute those supplies to the fisheries alone.

No sooner had peace, security, and good order, been restored, than the nation resumed its commercial spirit with new vigour, and from thencesorward the progressive flourishing state of Scotland is fully authenticated in the writings of British and foreign historians, as well as by charters, and parliamentary records.

The fifteenth century, opens an æra extremely favourable to the arts of civil life in that kingdom, particularly literature, science, husbandry, planting, commerce, navigation, and the fisheries. It introduces the pacific, the splendid, and truly patriotic reigns of the five James's, who were equally vigorous in executing, as their parliaments were in enacting, the numerous regulations and institutions which distinguished what may be termed the vertical period of Scotland's glory and happiness.

The death of James V. in 1542, closed the splendour, and in some degree the independency of that antient kingdom. The opposite factions under the influence of France and England, co-operating with the struggles which subverted the Popish religion, exhausted the internal strength of the nation, enfectled the excentric powers of government, desolated the country, and laid in ruins those noble edifices which it had been the work of ages to erect.

But though the nation was thus internally convulsed during the reigns of Mary and James VI. commerce still continued to flourish in a certain degree.

Louis

Azores, who supplied him with wine and water.

The principal exports from Scotland during the middle ages were cattle, peltry of various kinds; leather, wool, coarse wollen and linen goods; pearls, salmon, pickled and red herrings; pork, lead, and coals.

niards, met with three or four Scottish ships at the

The trade of the kingdom was chiefly carried on from St. Andrews, Dundee, Perth, Montrofe, Aberdeen, and the numerous ports of the Forth.

We now arrive at a period when patriotism disappeared, and when national improvements ceased. An event took place, which, though it sheathed the swords of both nations, proved in its consequences more fatal to Scotland than the politicians of those ages had foreseen. This was its giving a king to England in the person of James VI. anno 1602, by which the two crowns were inseparably united; an elevation extremely pleafing to James, who thereby became sole monarch of Great Britain, but which flruck so deep at the root of national prosperity in his native dominions, that many of the trading towns fell into decay, and have not yet been able to recower their former importance. The princes who had inspired the nation with noble sentiments, who had warmly patronized whatever constitutes the power, the opulence, and the elevation of states, being now withdrawn; the people lost their spirit, universal desection took place, and the nation funk back rapidly. into ignorance and infignificance.

In this deplorable situation did that country remain till the late reign, when a spirit of improvement, industry, and commerce, began to pervade the centre of ( xliii )

the kingdom. While the encouragement given to the linen manufacture gave new life to the decayed ports of the eastern shores, and roused them into action, the American commerce, and the bounties on the fisheries, animated those of the west.

The citizens of Glasgow, availing themselves of their situation, sitted out in 1718 the sirst vessel of Glasgow property that crossed the Atlantic. Their trade advanced by slow degrees till 1750; and from that period to 1775, it may be said to have slourished. In 1776, America prohibited all intercourse with Great Britain. In 1782, Ireland was admitted to participate in the American and West India commerce; and, in 1783, the American trade was said open to all the world. Thus vanished, after a short possession, all the exclusive commercial privileges relative to that country; for which, the Scots annihilated their parliament, their African and India Company; and subjected themselves to excises, taxes, duties, and commercial restrictions unknown before the year 1707.

#### Commercial Establishments.

All the commercial privileges which the Scots enjoyed abroad have been revoked, as before mentioned, excepting at Campvere in Holland, which is still the residence of a consul, or conservator, appointed by the royal boroughs of Scotland; and even, these privileges have of late been held on a precarious tenure, notwithstanding the obligations which Holland owes the former kingdom.

The court or convention of the royal boroughs in Scotland had its origin about the middle of the twelfth century. The number of these boroughs is at present fixty-fix, including the cities. Some of them are in ruins, others decayed, the harbours choaked up, and the corporations involved in debts. The boroughs are represented in parliament by 15 members; and, at the annual convention held at Edinburgh, by one commissioner from every borough, besides Edinburgh, which sends two. Their privileges extend to commercial affairs both within the kingdom and abroad.

In 1726, however, the convention, perceiving the miserable state of the nation, procured a new establishment, for the encouragement of sisheries, manufactures, and improvements, consisting of 21 trustees, who, so far as their very limited funds extend, have rendered their country the most essential services. The funds allotted for these great national objects consist of 5 or 6000l. arising from the forseited estates, and a small revenue from other sources; the whole, far too inadequate to the improvement of a kingdom.

In 1746, Archibald Duke of Argyle (the Mæcenas of Scotland) procured a royal charter for the establishment of a British Linen Company, with a capital stock of 100,000l. and which may be further increased as the affairs of the Company shall require.

# Present State of Agriculture, Manufactures, and Commerce.

Improvements in the various branches of husbandry, planting, and the raising a better breed of cattle and sheep, have made rapid progress in the Lowlands since the year 1750; but much remains to be done, particularly on those estates whose proprietors reside in other parts of the island.

Partly to the absence of those gentlemen, is owing the neglect of manufactures, and commerce, over a very considerable part of the kingdom; the banks of the Clyde, the Forth, and the Tay, with a portion of the east coast, as far north as Aberdeen, may be said to carry on the whole trade of the nation both inland and foreign.

Most of the countries to the southward of Edinburgh, and whose inhabitants composed, in antient times, the slower of the Scottish armies, exhibit at present a melancholy picture of decayed boroughs, neglected seats, and a dejected commonality. The this district hath a coast of near 200 miles, abounding in small harbours, and situated most admirably for western commerce; yet, from the head of the Solway Firth to the town of Air, there is neither manufacture, nor shipping beyond the size of the herring busses, althout would appear by the number of ports, and by tradition, that there was formerly a petty traffic in all those places.

The same remarks are applicable to the extensive coasts which reach from Aberdeenshire to the Pentland Firth. There is, however, amongst the gentlemen of the northern counties, a more general spirit for introducing small branches of manufacture, as also for planting, and other rural improvements. By these generous efforts, the hills begin to be covered with timber of various denominations, and so numerous as to exceed credibility. Of this, the estate of the late Sir Archibald Grant surnishes the most striking instance, that gentleman having, it is said, lived to see several millions of trees of his own planting, and mostly in full growth.

Of the various Classes and Degrees of People in the Lowlands, and their Propensity for the Manufactures of England.

It is scarcely necessary under this head to mention the nobility, gentry, and principal traders; their manners and modes of life being similar to those of the same ranks in England, from which country they supply themselves in the various articles of dress, furniture, and paintings.

Very different, however, in sundry respects, are the generality of the farmers of Scotland from their southern brethren. No sooner has the traveller passed the borders, than he perceives a striking contrast, not only in the appearance of the farms, houses, and cattle, but also in the countenances of the people. The men are sober, temperate, and laborious; the women equally diligent in raising coarse woollen and linen cloth, and other necessaries for the family, besides some

small matters, particularly linen and yarn, for sale. Some of the more fertile districts excepted, this class of people seldom enjoy the luxury of butcher's meat; wheaten bread, or even small-beer. These they chearfully relinquish, to gratify their propensity for English broad-cloth and other fineries, wherewith to adorn themselves on Sundays, and public occasions. Notwithstanding the incessant toils of the week, they attend all the duties of religion with the utmost punctuality, and are equally attentive to the education and morals of their children, infomuch that irregularities seldom happen, and crimes of a gross nature are scarcely known. Possibly, the number of executions in the course of justice, doth not amount to six persons annually, upon an average of years, throughout the whole kingdom.

Equally sober, industrious, and domestic, are the mechanics, whose earnings, excepting those who are engaged in the finer manufactures, do not exceed seven or eight shillings weekly. On this they dress in English broad-cloth; and their wives, occasionally, in silks from London. On this also, they bring up, educate, and set out for the world, those adventurous intelligent people, who abound throughout Europe, Asia, and America.

There is another class in Scotland, whose industry, and laudable pride, enable them to maintain themselves without troubling the parish, and at the same time contribute materially to the great staple of the kingdom. These are semales of various ages, and under various distressing circumstances; the orphan, the widow, and the aged mother; all those who have out-lived their kindred, or who receive no support from them. By unremitting application at the wheel, they gain two shillings weekly in, or near, the manufacturing towns; but those of the northern parts, and who are chiefly employed in knitting stockings, cannot, with the closest application, clear above eighteen pence. So slender an income implies a scanty subsistence, consisting of barley-meal, greens,

#### ( xlvn )

potatoes, butter-milk, whey, or water. A small moiety is reserved for a decent apparel, of home manufacture, wherein to appear at church; and though worn down with age, infirmities or neglect, they hold out with surprising chearfulness and fortitude, having always in contemplation, the prospect of a happier existence throughout eternity. This is also the consolation of the great body of people in that kingdom; the favourite subject of their conversation when in health, and the support of their minds in the days of affliction.

Upon the whole, when we consider the Lowlands of Scotland in a general view; the disposition, industry, and sober manners of the inhabitants; the millions of acres yet in a state of nature; the numerous decayed sea-ports, which might be restored; the abundance of sish, cattle, sheep, vegetables and roots; and that, of 32 counties, 18 export grain, not from the extraordinary crops, but the thinness of inhabitants; when we sum up all these circumstances, the aggregate will enable us to form an estimate of the importance of that division of the island; and this leads to the main objects of the pamphlet so far as they relate to that kingdom.

Scotland the most valuable Nursery of Seamen in the British Empire, England excepted.

The benefits which England derives from Ireland, America, Africa, the East and West Indies, have been the frequent theme of public discussion by the natives of the respective countries, or by persons whose interest or inclination it was, to set forth these advantages in the most favourable light.

Our derivative benefits, from the northern part of the united kingdom, in strength, and commerce, the of all others the most valuable, permanent, and improveable, have not hitherto been so forcibly represented, so fully understood, or regarded with such attention and respect, as their importance seem to re-

quire.

It is to be wished that we may not, for a long term of years, have occasion for such numerous armies as have lately pervaded the globe, and in which the Scots fupported, as usual, their military reputation: but a powerful, well-appointed fleet, and a proportionate number of men, always in readiness, will ever be necessary, both in peace and war. The great exertions, and the incredible expence of this kingdom, in raising, acquiring, protecting, and retaining, distant fettlements, had the navy in view, equally with commerce, because the one depended upon the other. The carrying trade to, and from, those settlements, respectively, was considered as so many sources which constituted England's glory and defence: but that conclusion admits of some exceptions. The trade to China and the East Indies, instead of being a nursery for seamen, is the consumer of that very useful class of people, and requires constant supplies from the temperate shores of Britain. The trade to Africa is equally destructive; and even the West Indies, being subject to all the disorders peculiar to the tropical climates, must debilitate and carry off great numbers of men, in a premature age.

The North American commerce was more favourable to longevity, and employed 8000 feamen, who

\*The religious commotions in Scotland during the reigns, of James I. Charles I. and II. and the inability of those princes, to carry their designs into execution relative to trade and the sisteries, disposed numbers of people to emigrate; some went to New-England, but the greatest number, particularly from the western counties, settled in the north of Ireland, and to the calamities of Scotland is owing the flourishing state of the Irish linen manufacture.

were, however, chiefly Britains; nor did America ever afford any supplies to the navy, and none is now to be expected from that quarter. On the contrary, the northern provinces are building ships of the line for our rival, to whose marine strength, by an unexpected turn in human policy, the forests of that great continent are at present devoted.

Such being the partiality of America towards France; and such the destructive nature of the carrying trade to all our remaining settlements, Canada, Nova-Scotia, and Newfoundland excepted, the Scottish sisheries claim the most serious consideration. That great nursery contributes, in a double capacity, to the aid and strength of this kingdom; it supplies equally the waste of the mercantile service, and the royal navy; enabling us to carry on the greatest trassic, and to mann the most victorious sleets that the world hath seen.

Previous to the American war, and when the bounty, at present limited to the herring busses, was regularly paid, the sisheries of that kingdom and the three divisions of islands employed 20,000 men, composed of perienced seamen, or persons who were advancing progressively in the naval profession.

The great superiority of this nursery to all others appears in the following comparative statement:

The commerce of the 13 States when in our possession, also Canada, Nova Scotia, and Hudson's Bay, employed

The whale fishery to Greenland, Davis's Straits, and other parts, encouraged by a 2000 large bounty, employs

The fettlements, colonies, and islands, stillssubject to Great Britain, in various parts of the world, employ, viz.

The Newfoundland fisheries employed of \ 20000

men and boys

This statement speaks at once to the understanding. We perceive that the Scottish fisheries, and of one species only, employ, in the proportion of ten seamen to one who are engaged in the whale fishery; above two to one of those who carried on the whole North American commerce while in our possession, and nearly equal to the number now employed in all our remaining settlements.

Of still greater consequence will these sisheries appear, when it is known that the herring and the white sisheries, upon the coasts, lakes, and firths of Scotland, could raise, and keep in constant readiness for other service, 50,000 phardy seamen, and at no greater expende to the public than a moiety of the expenditure thrown away upon a useless fortress.

The war at the Revolution employed 45,000 seamen. The number hath increased every succeeding war; and in 1782 it amounted to 100,000. The great efforts which France, aided by America, is now making in the naval department, require the same attention on our part, and in all probability the British sleet, at the breaking out of another war, will far

the rapid increase of trade with the mother country and the West Indies, will in a few years employ 2 or 3000 British seamen. On the other hand, the Newfoundland sisheries will in all probability sall chiefly into the hands of France, Nova Scotia, and the northern States of America.

At the Union, and some time after, from 6 to 800 boats were engaged in the herring sishery upon the Forth, and each boat employed 3 or 9 men. The sishery in the Murray Firth employed from 5 to 700 boats, of a smaller construction, and navigated by 6 or 7 men each. These sisheries have, for want of due encouragement, much declined. But the great sisheries are those on the western and northern shores, of which the reader will find a circumstantial account in the following narrative.

( li )

exceed that of the present period, great as it is. An additional number of men will confequently be wanted: and as the manning of the navy hath ever been attended with confiderable difficulty and expence to government, and with circumstances of oppression towards many who are dragged into that fervice against their consent; there is not, in the whole system of British politics, an object of greater importance to the defence and prosperity of the kingdoms, than that of increasing the number of hardy, intrepid seamen, by means of the northern fisheries and coasting trade. The arguments for a vigorous attention to this national object derive additional force from the sober manners and tractable dispositions of those men, a circumstance well known to the naval officers, and much approved of by them.

Scotland considered as a commercial Nation, and its great importance to England in that view—Some Proposals for a more liberal System of Polity relative to Scotland, with conjectural Estimates of the beneficial Consequences which would flow therefrom, to the whole Island.

It hath been observed, that a spirit of industry, trade, and rural improvements, began to revive in Scotland about the year 1727, in consequence of the American commerce carried on from Glasgow, and of some salutary, tho incomplete measures of government respecting the linen manufactures, and the western sincheries, by which the whole kingdom was more or less benefited. Since that time, more especially from the year 1750, the demand in Scotland for English manufactures, and various foreign articles thro the channel of London, as silk, drugs, tea, and India goods, gradually increased, till the satal commencement of the American war in 1775, when the annual value of English exports to Scotland had amounted to

The ready money spent by the Scots nobility and gentry residing in England

2,600,000

being within a million of the whole exports of England, in the memory of man. The superiority of Scotland in a commercial view, at the present period, to any other channel or source of trade, will further appear from the following comparative statement, taken from Sir Charles Whitworth's Commercial Tables for 1771, that being the highest year of English exports, particularly to the American States, where the imports from this kingdom never amounted to 1,800,000l. upon an average of years.

Since the year 1748, the annual amount of English imports hath gradually increased from 9 to 12,000,000l. while that of exports from 1771 hath been gradually decreasing, insomuch that the balance, which, upon an average of 50 years previous to 1771, had been above 4,000,000l. in favour of England, did not, at the conclusion of the late war, amount to 1,000,000l. after deducting the value of stores and other supplies for the army and navy. Nor are there any good grounds to hope, that the national exports to foreign parts will again produce a balance of 4,000,000l. or even half of that sum, for a permanency of years.

The balance with Russia, Sweden, and other countries upon the Baltic, hath always been against England, owing to the importance of the articles which we receive from thence, to manufactures, and the navy. Our exports to Portugal, Italy, Turkey, and the Streights, have lately decreased to the amount of a million annually, which France hath gained; and similar desciencies, by means of that politic nation, may be expected with other European kingdoms, the trade of Russia excepted.

In America, the prospect is still more gloomy. As those states are seducing artists and manufacturers from all the commercial nations of Europe, and as their country abounds in raw materials, as iron, copper,

a 3

timber,

timber, furs, peltry, cotton, hemp, flax, indigo, and filk; it may be prefumed, that they will reflect their imports from this country to such articles only as they cannot raise within themselves, and, instead of being a general customer, become a rival much sooner than we imagine.

The same may be said of Ireland, whose non-importation agreements furnish matter of serious concern.

Upon the whole, the luxury of the times hath confiderably increased our imports, while the exertions of France, the independence of Ireland, and America, have so greatly abridged our exports, as to bring both nearly to a par. And though the commercial balance is decreased, or nearly annihilated, the drain of specie, by the East India Company, smuggling, the interest of public debts paid to foreigners, and remittances to absentes; amounting to more than 2,000,000l. annually, remains the same; which emissions will soon be attended with very alarming consequences, unless speedily checked, or new sources of commerce are opened.

Some of the negative remedies to these unfavourable circumstances are now the subject of parliamentary discussion; others, we would gladly hope, will be brought forward in gradual succession, while the productive fources of a commercial balance demand an equal degree of attention. We perceive from the foregoing tables and estimates, that, as the Scottish fisheries are the most valuable nurseries for seamen, fo is its trade, and its expenditures in England, the most beneficial to our manufactures. With some nations we carry on a losing trade; from others we receive an uncertain balance; and even the tenure by which we possess our distant settlements, and the monopoly which we derive from them, are so extremely precarious, that it would be political infanity to build our future prospects upon such speculative sources. Whereas, the benefits which flow from the northern part of the island are progressive and permanent; and, could we reconcile our minds to the idea of relinquishing a comparatively small portion of revenue, the influx flux of specie from that country would be sufficient for the important purposes of "feeding the circulation of the kingdom," and of a growing national wealth, admitting the balance with other countries to be upon

an equality.

The income or wealth of Scotland, whether arising from rural improvements, the industry, and temperance of the people, or its commercial balances from foreign countries, center, and ever will center, with England. The gentry of the former kingdom have mostly trebled their rents since the year 1750, yet they are not wealthier than their forefathers. On the contrary, the increase of income, though incredibly rapid. hath not, amongst the generality of families, corresponded with their taste for the elegancies, and the luxuries of a more opulent people, infomuch, that estates are constantly upon sale, the old families gradually disappear, and the landed property falls into new hands. especially in the neighbourhood of Glasgow, and other trading towns. This is the natural course of things with those orders of men. Their rents are either fpent by themselves in England, or carried thither circuitously; nor will it ever be otherwise with the gentry of Scotland, while London continues to be a. universal storehouse of whatever is pleasing to the eye and the senses; the centre of amusements, affording irrefiftible allurements for diffipating, in a fashionable style, the produce of their estates, and sometimes more.

The inferior orders, as hath been observed, are equally emulous of English sinery, a species of pride, which, while it stimulates industry in one kingdom, promotes manufactures in the other. Thus the foibles of the higher, and the virtues of the lower classes of people in Scotland, become subservient to the opulence and prosperity of England, in a very considerable degree. Every man, who, through unremitting labour, gains the small pittance of seven shillings weekly, becomes a customer to the wealthy English farmer, clothier, or draper, besides bring-

a 4

We may therefore consider the trade of Scotland as our principal mart, and the landed property of that kingdom as an inexhaustible mine; from which channels flow a permanent influx of specie, with this peculiar circumstance in favour of those sources, that they require no fleets and armies, no waste of lives, and of millions, to defend. From that country, therefore, we derive every possible benefit, negative and positive; and which, with the judicious appropriation of a suitable fund, will accumulate beyond con-'ception; for it is to be remembered, that a very confiderable part of the country is in a state of nature; that other districts admit of further improvement; and that the manufactures and commerce of the kingdom are mostly limited to the three navigable rivers, and a portion of the eastern coast only. When a spirit of trade and improvements becomes more univerfal, pervading every shore, and every valley of the nation; and when the metropolis shall attract a more numerous refort of wealthy strangers, the consequences will be proportionably great.

The good effects of vigorous measures, supported by aid of government, are boundless; of which the present century affords some striking instances. Russia, from an immense desart, inhabited by Barbarians, and only known by name to the southern states of Europe, hath become instantaneously the seat of arts, science, and literature; a general emporium of European and Asiatic commerce; and bids fair in another century to equal, if not eclipse, the most celebrated empires of the world.

The progress of the British American colonies, under the direction of their respective assemblies, assisted liberally by the mother country, hath no parallel in the annals of antient or modern nations.

The present state of Ireland, a country nearly similar to Scotland in dimensions, local situation, climate,

mate, and natural produce, requires on that account a more circumstantial detail. That kingdom had been an expensive burden to England, from the time when it became subject to the latter nation in the reign of Henry II. to that of Queen Elizabeth, including a period of 385 years.

"In 1573, the money which the queen had fent to Ireland, since her accession to the throne anno 1558, being computed, came to 490,7791 whereas the whole produce of the revenue of Ireland, during all that time, amounted but to 120,0001." being 80001 per annum.

"In 1641, part of the walls of Dublin fell down, which lay unrepaired for want of money until the Lords Justices sent the citizens 401 to advance that service. In 1644, the citizens of Dublin were numbered, and found to be 5551 Protestants, and 2608 Papists, in all 8159." Corke and Waterford were still less considerable; and it is beyond a doubt that the ports of Leith, St. Andrews, or Dundee, in Scotland, then carried on, and had for many ages, more foreign commerce than the whole kingdom of Ireland.

Towards the commencement of the present century, the parliament of Ireland began to direct its attention to national improvements, and with such perseverance and success, that the public revenue, which in Queen Elizabeth's reign produced only 8000l. annually, amounts at present to 1,000,000l. though the excises, taxes, and duties, are so light as scarcely to be felt by the inhabitants.

Of this revenue the parliament allots a considerable moiety towards encouraging agriculture, industry, and manufactures, as appears by the Journals of that truly patriotic senate. By means of these supplies, and the judicious application of them, Ireland may, at this time, be considered both as a manufacturing, and a commercial country; and, promises to become, soon, a considerable emporium. The increase and splendour of Dublin correspond with the growing wealth of the

nation.

If such hath been the rapid transition from ignorance, sloth, and extreme penury; to opulence, splendour, and national importance, in less than 90 years, what may not be expected from a civilized, industrious people, were they equally supported by adequate funds operating in every department, and amongst all denominations, from the sisherman and aged spinster, to the counting house of exports and imports? The education, sober manners, and domestic turn of those people, qualify them, most eminently, for meeting government half way in every beneficial measure, and no period since the Union required more vigorous efforts, on both sides.

The loss of the exclusive trade of America, the impediments to commerce and the fisheries, in confequence of a feven years war, have checked the progress of the western parts, and reduced many families from affluent circumstances to the verge of bankruptcy. The almost infurmountable difficulties of the working people, in consequence of frequent bad seasons, and the successive high prices of grain, attended at the same time with accumulating excises and taxes upon trade, and the necessaries of life, have filled the whole kingdom with murmurs, and feem to threaten a decrease of the linen manufacture, hitherto the national staple, and which also serves, in their traffic with England, as a substitute for specie, that article being drained from the nation by other channels. The general decay of the fisheries on the eastern shores, and the very injudicious impediments to that important branch throughout the whole kingdom, as

enumerated in the subsequent detail, are objects also of the most serious concern.

Equally alarming is the late decrease of exports, to foreign countries, and the consequent increase of an unfavourable balance, of which the following is an authentic statement:

an authentic statement:
In 1770, the balance in favour of Scotland had arrived at
1780, it fell to
1781, it was against Scotland
1782, it researches

1782, it rose to 155,313 And it ought to be observed, that, whether the commercial balance be in favour or against that kingdom, there is, and ever must be, a drain of specie for grain, amounting to more than 200,000l. annually, upon an average of years; which, with the balance to England, and the remittances of rents as already stated, forms an aggregate far beyond the unassisted exertions of Scotland to support for a permanency of time. The consequences of a losing trade with foreign nations will be a proportionate decrease of imports from England, and of the balance in favour of that kingdom. Of the exports from Glasgow previous to the American war, three-fourths were of English produce or manufacture. The exports of that city being now reduced, the commissions to England are proportionably abridged.

Upon the whole, the interest of Scotland is in every possible respect the interest of England. Both kingdoms are inseparably united by nature, and they will rise or fall together. All local distinctions ought therefore to cease, and all persons who endeavour to sow, or keep up a slame of discord, should be considered as enemies to their country, by destroying that harmony which constitutes our strength, security, and reciprocal benefit.

Such is the relative situation, natural and political, of both countries, and such their dependence upon each other. After, therefore, contemplating the subject in every point of view; the distresses under which

Scotland labours from soil and climate, its great diftance from the feat of government, its having no invigorating national affembly within itself, no adequate funds for the great purposes of general improvements; in confideration also of the loss of America, the drain of specie by the nobility and gentry. and other objects as stated in these pages; the most efficacious means of supporting that country, and of promoting the general prosperity of Great Britain, would, I humbly conceive, be to abolish all taxes, duties, and excises in Scotland, the land-tax excepted; and, instead thereof, to substitute such duties only, as shall seem necessary, for the regulation of trade and commerce between both kingdoms; the produce of which duties, together with the land tax, to be vested in the board of truftees at Edinburgh, and to be by them applied, unalienably, to the improvement of Scotland, the encouragement of the fisheries, manufactures, and other falutary purposes, as shall from time to time appear conducive to the prosperity of the kingdom, and the happiness of the people.

And it is further submitted to consideration, whether the board of trustees, consisting at present of 21 members only, should not be established upon a wider basis, and to include, for the time being, the whole body of the nobility of Scotland, the lords of session, barons of exchequer, the crown lawyers, and the ministers, professors, and magistrates of Edinburgh. In order still further to combine the national force in one respectable establishment, it is submitted to consideration, whether it would not be proper to consolidate this board and the convention of the royal boroughs, the whole constituting a Commercial Parliament, or Callege of Commerce, entrusted with such powers as government shall deem expedient.

An Institution thus composed of persons of the first eminence, would restore public spirit among the higher orders, call forth the exertion of mental powers, encourage general industry, revive the drooping mind,

and gladden every heart. Each individual would find employment, and comfortable subsistence for his family; tumults, murmurings, and emigration, would cease or abate; gratitude to majesty, and an enlightened government, would pervade the kingdom, and the most distant islands.

Were further arguments necessary to enforce the expediency of these propositions, it might be observed, that the revenue of Scotland, though burthensome to the people, is comparatively so very inconsiderable to that of England, that, were the pen drawn through every item of it, the deficiency in the estimate of ways and means would scarcely be observable; while the advantages, which would flow into England by the various channels which have been enumerated, would exceed credibility. Such was the main argument of the American colonies so late as the year 1776. They contended that the magnitude of their imports from the mother country included within it a productive revenue, and a profitable commerce, centering in Great Britain. The same reasoning is applicable to Scotland. Exempt us, fay they, from restraints on trade, from vexatious excifes on our infant manufactures and the necessaries of life, from the expenfive burden of revenue officers, and you will gain a hundred-fold, by means of the profits of our industry, which will ultimately circulate in your manufacturing towns, and by the revenue upon your goods which we consume. But, should we, after thus contributing to your opulence and splendour, be deprived of every fourth candle, every fourth pound of foap, and bushel of coals, we shall neither be able to weave nor bleach; our aged parents will languish through cold or famine; and the young men who promifed to become beneficial customers will fly, indignantly, beyoud the seas, and thus be lost to their families, to their country, and to you.

Consider, we beseech you, whether a people labouring under every possible disadvantage, natural and political, of whom two thirds live, or rather exist, upon

meal,

meal, vegetables, and butter-milk, be proper objects whereon to lay, with the same indiscriminate hand, the burdens of your ruinous wars, in which they had no concern, and from which they could derive no advantage. Consider whether a bleak, narrow country, composed in general of rock, heath, and sand; whose commercial balance of late with foreign nations, and at all times with you, hath been unfavourable, can ever produce an efficient revenue.

So completely drained is that kingdom of its specie by England, that though at the time of the union the circulation amounted to nearly 1,000,000l. sterling, the whole currency of the kingdom hath not for many years exceeded 200,000l. and even that trisling sum is purchased in England for the purpose of supporting the circulation of the Scottish banks, at an expence of 4000l. per annum; nor can it be otherwise in a country where London bills often sell at a

premium of two per cent.

Upon the re-coinage some years ago, the specie of Great Britain and Ireland was found to be nearly as follows, viz:

In England — £. 17,000,000
Ireland — 3,000,000
Scotland — 200,000

20,200,000

Neat amount, (exclusive of the land-tax) 163,598 in the collecting of which, the people were burdened with an expence of 43,254

Thus the country pays above one-fourth more than is received at the exchequer, and it is certain that many of the taxes scarcely defray the expence in collecting them. The excises have, however, increased considerably since 1773; and some writers unacquaint-

( lxiii )

ed with the abilities of the country, or inattentive to the fallacious causes of that increase, exult on the imaginary flourishing state of the kingdom, and the progressive revenue which may be expected to slow therefrom.

That this increase is derived from impolitic sources, every reader will readily allow, when informed, that it arises chiefly from additional duties on salt, soap, printed cloths, and other articles highly prejudicial to sisheries and manufactures; also from distilleries, tho the kingdom depends upon other nations for daily support in meal and grain.

Most certain it is that nature hath put a negative against productive revenue, and extensive agriculture in that kingdom; enduing it, however, by means of other channels, with the sources of employ, and active business. Were government, therefore, to follow this unerring guide, to co-operate with it in the great lines of political administration, and to consider Scotland, not as an object of revenue, but of trade, the following estimates will show the prodigious advantages that would flow to England from the propositions before stated.

Admitting 200,000l. annually to be the utmost extent of neat revenue in Scotland, and also the given sum for its improvement, the progressive increase of population, naval strength, imports from England, and the influx of specie to that kingdom, would, we conjecture from the above-mentioned circumstances, be found at the end of fifty years as follows:

We shall state the population in 1784 at

The men employed in the fisheries in the best years

The imports from England as they

flood before the f. 2,000,000 do. 4,000,000

nearly

Rents, &c. spent

in England by \ \( \frac{1}{600,000} \) do. 1,000,000

Scotimen

Whereas 10,000,000l, the amount of the above stated 200,000l annually, for a period of fifty years, would be exhausted in six months, if expended, agreeably to the old system, in destructive war. Such would be the opposite effects in the operation of the same specific sum, circulating within our own island, upon the arts of peace; or lavished amongst distant regions, in he prosecution of imaginary glory, external dominion, and fallacious channels of commercial monopoly.

Unhappily, the present situation of government, and its forlorn hope, the broken reed of the Ganges, afford no flattering prospect that any arguments tending to the abridgment of the national sinances will produce the desired effect. The deduction of facts related in these pages, the statement of positive grievances, and the expediency of redressing them, may, however, attract some notice, and dispose our rulers to look favourably towards a people whose life is one continued struggle, and whose patience is nearly exhausted.

Supposing, therefore, that government should not be disposed to delegate the internal affairs of Scotland in the manner now suggested; but desirous, at the same time, to give every possible relief consistent with the abilities of the state; in that case, a general revisal of the civil policy of the kingdom, though less essications than the former proposal, would be productive of essential benefits to every class of people.

For this purpose a committee of enquiry might be appointed, to take into consideration the state of the kingdom, beginning with those objects which require

( 1xv )

immediate attention, as the fisheries, and inland navigation; the linen manufacture in all its branches; the unproductive excises or duties, which it would be expedient to abolish; the regulation of taxes partially imposed on that part of the united kingdom \*; the oppressive duties on coals †, and vexatious sees, or custom-house dues, on small crast navigating the Firths.

It would require a whole volume to enumerate, bring forward, and explain the various objects which await the attention of a committee thus appointed; and, as public spirit begins to revive amongst the representatives of North Britain, we entertain a hope that this season of peace will be appropriated to these great purposes; we are the more confident in these expectations, from the confideration that the age is more enlightened respecting the relative operations and effects of commerce. Writers of the first abilities have lately exploded that contracted fystem which impoverished the distant branches to-aggrandize and enrich the centre: and, if we may judge from the adventitious propositions made to the American colonies by the earl of Carlifle, and the concessions made to Ireland; it would feem, that government hath

carts, drawn by one little horse, and a man seems to derive some degree of dignity and importance from the reputation of possessing a two-horse-cart;" but so unequal are some taxes levied, that these small carts, whose loading do not probably amount to that of two wheel-barrows, are subject to the same duty as carts in England which contain fix times the quantity.

A portion of Scotland lying upon the Solway Firth, produces neither turf, coal, nor limestone. The two last articles are consequently brought by an expensive sea carriage from Cumberland; and, though coals are unavoidably necessary for the purposes of agriculture, and domestic use in that cold climate, a duty is levied upon the coals, when landed, of six shillings per chaldron. The miserable Highlanders, and the whole northern parts of the kingdom, are also saddled with these impolitic burdens as mentioned in the following pages, so that in fact the people are slaved in a double sense; and improvements thereby frustrated, where they ought to be vigorously encouraged. These, and similar instances which could be given, will serve to ensorce the expediency of a parliamentary enquiry and redress.

happily adopted the same generous sentiments. A conscientious regard to the common rights of mankind knows no distinction of country, or local situation. Neither is it politic. From favours partially conferred, or burdens injudiciously imposed, arise commotions, revolt, and civil war; while an equal diffusion of benefits, protection, or redress, suited to cases and circumstances, is government founded on the sure basis of philosophy, and political wisdom; principles inseparably connected, by the Ruler of the universe, for the benevolent purpose of uniting all the various parts of empire in one common interest.

The half-starved Highlander, inured to the inclement feafons and barren heaths of the 58th degree, is an improper object of taxation; but he supplies his country, and its fugar islands, with fish; takes upon him the toils of war, refreshes himself after the fatigues of the day, upon a bed of snow; and is always prepared to renew the march, or the attack, with new vigour. While, on the other hand, the opulent citizen of the sist degree, is unqualified for fuch exercises; but he contributes liberally to the revenue, supplies the ways and means, supports the credit of the state, and the honour of the nation. Thus every denomination of subjects furnish their quota to the general stock of commerce, revenue, strength, or defence, and have an equal claim to the notice of government.

Having thus attempted to state the relative situation of the various branches which compose the British empire in general, and the two British kingdoms in particular, with a view to that system of policy which seems to be the most equitable, and most conducive to the benefit and security of the whole; I shall close this part of the subject in the words of certain writers, whose distinguished reputation, unanimity of sentiment, and thorough knowledge of the true interest of their country, will establish the positions which I have been endeavouring to enforce.

( lxvii )

Mr. Arthur Young. "Had the millions, and tens of millions, which have been expended on the original fettlement and subsequent protection of the colonies, been laid out on the melioration of England, this kingdom would have had at present double the quantity of cultivated lands, and double the number consequents."

Dean Tucker. "Suffice it to observe, that the wars of Europe for these 200 years last past, by the confession of all parties, have really ended in the advantage of none, but to the manifest detriment of them all: suffice it further to remark, that had each of the contending powers employed their subjects in cultivating and improving such lands as were clear of all disputed titles, instead of aiming at more extended possessions, they had consulted both their own and their people's greatness, much more efficaciously than all the victories of a Cæsar, or an Alexander."

The Dean, after enumerating the true principles and real causes of our increase of trade since the Revolution, proceeds thus:—"Now all these things cooperating together would render any country rich and flourishing, whether it had colonies or not: and this country in particular would have found the happy effects of them to a much greater degree than it now doth, were they not counter-acted by our luxury, our gambling, our frequent ruinous and expensive wars, our colony-drains, and by that ill-gotten, and ill-spent wealth, which was obtained by robbing, plundering, and starving the poor defenceless natives of the East-Indies.—A species of villainy this, for which the English language had not a name, 'till it adopted the word nabobing."

Lord Sheffield. "Fisheries, coasting trade, and northern voyages, produce hardy and intrepid seamen; African and Indian voyages destroy many, and debilitate more.

"It should never be the policy of England to give a particular encouragement to sedentary fisheries, at the distance of 3000 miles, as they interfere so much with the sisseries carried on from the coasts of Great Britain and Ireland.

"The fish from New-England and the country adjacent cannot be put in competition with the herrings fent in great quantities from Scotland and Ireland; nor should any regulation be made likely to affect this nursery for seamen, which may be greatly increased with proper attention.

"If any thing like policy is preserved in this nation, we shall have ship-building in every port and creek of Britain and Ireland, by the encouragement which we ought to give every sishery, and to every art connected with navigation.

"Nothing can be more impolitic, at least in a commercial nation, than a fondness for foreign dominions, and a propensity to encourage distant colonization, rather than to promote domestic industry and population at home. The internal trade of Great Britain is much greater than its external commerce. The best customers of the manufacturers of Britain are the people of Britain.

"Europe has been long wild and extravagant in looking towards America for every thing; fortunately for France, she failed there, but in her pursuits lost more glory than she had attained elsewhere during a century. Spain has been impoverished, and is much reduced below what she was before she suffered from her American delusions. England survives; and it is to be hoped will survive her American misfortunes; that she will learn wisdom from what has happened; and that she will no longer squander her riches heedlessly at a distance, and out of her reach. Britain may have the good fortune to see her sisheries surpass those of the rest of the world, and to raise sive seamen of the best and hardiest kind for one she does now."

The Bishop of Landass having, in his Sermon before the House of Lords, put the most favourable construction

#### (lxix)

struction upon the present state of public affairs, sums up the whole, in the following musical language.

But great and happy as we are, there is much room left for those whom it may concern to make the attempt of rendering us greater and happier: and we sincerely pray to God that all parties may be disposed to do this, not by sacrificing public considence to private animosity; the stability of government, to selfish or ambitious struggles for power; not by indulging a proud propensity to embrace the first favourable opportunity of regaining our glory, as it is called, by the renewal of war; not by prosecuting unjust views of commercial monopoly, or territorial conquest, in distant countries \*; but by taking the most prudent measures at home, to heal our divisions, and amend our morals; for the strength, foreign and domestic, of every nation upon earth, must ultimately,

\* "I wish," says the Bishop, "I could consider our acquisitions in Asia as compensating our loss in America; but they have been obtained, I fear, by unjust force, and on that account I cannot think that they will be useful to us. It requires little political satisfactions; that it will be expended in the maintenance of the standing army by which it must be collected; that our enemies in Europe, from Asia, will endeayour to counteract all our projects of interest and ambition, and to make that country another America to this nation."

The East India Company hath ever been obnoxious to the king-dom, infomuch, that in the reign of King William, petitions were presented from various parts of the country for its dissolution. Even the House of Commons addressed the King to the same purpose; but, says a historian of that period, "those who had been the most warm in detecting abuses suddenly cooled; and the prosecution of the affair began to languish."

The abuses of the company's servants in latter times are well known, but still it is contended.

1. "That the India trade is a valuable nursery for seamen".—To this proposition it hath already been observed that these very distant and sultry voyages are the destroyers of that class of men.

2. "The trade to India is the grand channel of English commerce, and will enrich the kingdom by the magnitude of its exports and imports".—The exports to India, till we became possessed of the territorial revenue of that country, consisted chiefly of specie for the purpose of completing the investments or cargoes sent from thence to England.

The following periodical statements of the value of goods exported thither since the commencement of the present century, compared with our exports to Holland, Germany, and Spain, are extracted from Sir Charles Whitworth's Commercial Tables; viz.; we exported in

To India. Holland. Germany. Spain. 629,997 1700 126,697 1,765,951 610,212 1710 126,310 2,071,306 975,803 215,935 83,811 1,915,112 1720 760,224 499,324 1730 135 484 1,766.526 1,092,490 777,949 281.751 1,754.204 1,091,061 101,635 1750 508,654 2,204.095 1,255,872 1,783,075 1,161,670 (1,784,442) 1,544,016 (1,048,222)

The exports to Portugal used formerly to treble those to India; and Flanders hath of late equalled, if not exceeded, the whole Eastern commerce. Thus our intercourse with several kingdoms of Europe is incomparably superior to that of India, and without any expence

To government.

3. The East India trade produces a considerable revenue, and is consequently a great support to the state. This is the charm which hath long influenced the British councils, and from which we may trace partly the dismemberment of our empire, and the present embarrassed situation of the kingdom. It is well known that the cargoes of tea sent to America with a view to serve the India Company, and clogged with a duty of three pence per pound, renewed those commotions which terminated in the loss of that empire. For this also, we permit the Company to pour into these kingdoms whole cargoes of muslins, callicoes, dimities, shawls, nankeen, china ware, and other Asiatic manufactures, to the great injury of our merchants and traders, and by which 200,000 working people are deprived of their natural right. It hath also been alledged by many, that the heavy excises laid time after time, upon British printed

Admitting this to be a groundlefs furmife, it is, however, beyond a doubt, that our Oriental connections have, in a general view, proved extremely prejudicial to the honour and interest of this nation. And it would feem, that the only means whereby that country may be rendered really and permanently serviceable to government and the community, would be to regulate its commerce by a general prohibition of all stuffs and cottons of whatever denomination, those for reexportation excepted. These, with the raw materials, and other articles, the natural produce of Asia, as silk, saltpetre, spices, drugs, tea, and diamonds, would still enable the Company to carry on a respectable, sure, and prostable trade and to restore their credit and their honour, without prejudice to India, or their native country.

cottons and linens, originate in Leaden-hall street.

# THE HIGHLANDS, &c.

Divisions and Face of the Country.

SCOTLAND admits of two grand divisions, the Lowlands and the Highlands.

The first division comprehends the countries southward of the Forth, with the eastern coast, as far north as Inverness. In this division the language, manners and dress of the people are nearly the same as in England. This is also the most fertile and improved part of the kingdom, wherein are situated the towns of any note; the seats of manufactures, commerce and navigation.

The second division comprehends the west side of the kingdom, from Cantire to the Pentland Firth, with the Hebride Isles; also the interior parts of Scotland, from the Firth of Clyde, Loch Lomond and Loch Tay northward; and here the people speak the Erse or Gaulic language, dress in the antient Roman manner, and have, till of late years, lived almost in a state of nature.

The face of the country, in this division, exhibits one great mass of rugged mountains, appearing in all manner of directions, covered on the sides with heath

D

or

or natural woods, and on the summits with everlasting snow. These mountains are separated from each other by vallies, straths or glens; and, in some places, by narrow deep chasms, darkened with timber, through which the united tributary streams of the surrounding mountains roll with great impetuosity, till they vent themselves in some inland lake; but, more frequently, in the capacious bays formed by the Atlantic, on one side; or the British Sea, on the other side of the island.

The Hebrides, or Western isles, are about 300 in number, 40 of which are inhabited. In extent, collectively, they are nearly equal to Wales; they cover almost the whole western coast of Scotland, and contained, before the late emigration, 48,000 people. The language, manners, dress and face of the country are similar to those of the opposite coast of the continent, but the timber hath been completely exhausted.

The names of the principal islands, and the number of inhabitants before the late emigration to America,

#### The Distresses of the Highlanders.

Such being the natural state of the Highlands, the only parts capable of agriculture are the vallies or glens around the bases of the mountains; and these vallies having the sun for a few hours only, vegeta-

tion advances flowly, and the harvests are always late. The climate is equally discouraging to the purposes of husbandry. The spring is bleak and piercing; the summer is cold and short; the autumn, from the beginning of August, deluged with rains; the winter long and tempestuous. During the latter season the people are cut off from all communication with the Low Countries, by deep beds of snow, impassable torrents, pathless mountains and morasses on the one side; by a long and almost impracticable navigation on the other.

To these accumulated discouragements of nature, are added the oppressions and ill-judged policy of many proprietors of those sterile lands, far beyond their natural value, were they even in hands more capable to improve them. Where both foil and climate conspire against the raising of grain in any confiderable quantity, and where there are no markets, possibly, within the distance of fifty miles, for the sale of corn and the leffer articles of husbandry, the farmer turns his attention chiefly to the grazing of a few cattle and sheep, as the means whereby he expects to pay his rent, and support his family. If, therefore, his farm hath been raised at the rate of 300 per cent. while the price of cattle hath scarcely advanced 100, this method of improving estates, as the proprietors term it, furnishes a high-sounding rent roll, extremely pleasing to human vanity, but which, being founded upon oppression, injustice and folly, hath hitherto proved fallacious and humiliating, to all those who have persevered in the cruel experiment.

Upon the whole, the fituation of these people, inhabitants of Britain! is such as no language can describe, nor fancy conceive. If, with great labour and fatigue \*, the farmer raises a slender crop of

<sup>\*</sup> Instead of the plough, the farmers generally use the spade, partly through necessity, arising from the irregularity of the surface, and partly from antient custom. The rainy season commences about the first of August, and continues, with little inter-

bility of affistance elsewhere.

Nor are his cattle in a better fituation: in summer they pick up a scanty support amongst the morasses, or heathy mountains; but in winter, when the grounds are covered with snow, and when the naked wilds afford neither shelter nor subsistence, the sew cows, small, lean, and ready to drop down through want of pasture, are brought into the hut where the samily resides, and frequently share with them the small stock of meal which had been purchased, or raised, for the samily only; while the cattle thus sustained, are bled, occasionally, to afford nourishment for the children, after it hath been boiled, or made into cakes.

The sheep, being left upon the open heaths, seek, to shelter themselves from the inclemency of the weather amongst the hollows upon the lee-side of the mountains; and here they are frequently buried under the snow, for several weeks together, and in severe seasons during two months or upwards. They eat their own and each other's wool, and hold out wonderfully under cold and hunger; but even in moderate winters, a considerable number are generally found dead after the snow hath disappeared, and in rigorous seasons sew or none are left alive.

Meanwhile the steward, hard pressed by letters from Almack's or Newmarket, demands the rent in a tone which makes no great allowance for unpropi-

mission, till November. When, therefore, the corn is cut down, which is performed by hooks, a number of sheaves are piled together, and thatched on the top. In the first interval from rain, the thatch is taken off; and the sheaves, if dry, are carried to the barn. This laborious work is repeated until the whole crap hath been thus secured.

(5)

tious seasons, the death of cattle, and other accidenta misfortunes; disguising the feelings of his own breast —his Honour's wants must at any rate be supplied,

the bills must be duly negotiated.

Such is the state of farming, if it may be so called, throughout the interior parts of the Highlands; but as that country hath an extensive coast, and many islands, it may be supposed that the inhabitants of those shores enjoy all the benefits of their maritime situation. This, however, is not the case: those gifts of nature, which in any other commercial kingdom would have been rendered subservient to the most valuable purposes, are in Scotland lost, or nearly so, to the poor natives, and the public. The only difference therefore, between the inhabitants of the interior parts, and those of the more distant coast, consists in this; that the latter, with the labours of the field, have to encounter, alternately, the dangers of the ocean, and all the satigues of navigation.

To the distressing circumstances at home, as stated above, new difficulties and toils await the devoted farmer when abroad. He leaves his samily in October, accompanied by his sons, brothers, and frequently an aged parent; and embarks on board a small open boat, in quest of the herring fishery, with no other provision than oatmeal, potatoes, and fresh water; no other bedding than heath, twiggs or straw, the covering, if any, an old sail \*. Thus provided, he searches from hay to bay, through turbulent seas, frequently for several weeks together, before the sheals of herrings are discovered \*. The glad tid-

ings

<sup>\*</sup> The Highland dress, lately resumed, is extremely weful to these people when on board; as well as in the field. The plaid contains sundry yards of worsted stuff, which the Highlander wraps several times round his body, and lies down amidst snow, hoary frost, rain, or salt water, and thus reposes himself.

<sup>†</sup> Though the arrival of the herrings be certain, and almost to a day, yet the particular lake, bay or channel to which they did & B 3

which awaits him at home does it most effectually. Having disposed of his capture to the Busses, he returns in January through a long navigation, frequently amidst unceasing hurricanes, not to a comfortable home and a chearful family, but to a hut composed of turf, without windows, doors, or chimney, environed with snow, and almost hid from the eye by its astonishing depth. Upon entering this solitary mansion, he generally finds a part of his family, sometimes the whole, lying upon heath or straw, languishing through want, or epidemical disease; while the few surviving cows, which possess the other end of the cottage, instead of surnishing further supplies of milk or blood, demand his immediate attention to keep them in existence.

The season now approaches when he is again to delve and labour the ground, on the same slender prospect of a plentiful crop or a dry harvest. The cattle which have survived the samine of the winter, are turned out to the mountains; and, having put his domestic affairs into the best situation which a train of accumulated missortunes admits of, he resumes the oar, either in quest of the herring, or the white sishery. If successful in the latter, he sets out in his open boat upon a voyage (taking the Hebrides and the opposite coast at a medium distance) of 200 miles, to vend his cargo of dried cod, ling, &c. at Greenock or Glasgow. The produce, which seldom exceeds twelve or sisteen pounds, is laid out, in con-

their course, remains unknown, until the vast flight of Solan geese and other birds which attend the shoals, lead to a discovery.

junction

junction with his companions, upon meal, an I fishing tackle; and he returns through the same ted ous navigation.

The autumn calls his attention again to the field; the usual round of disappointment, fatigue and distress awaits him; thus dragging through a wretched existence, in the hope of soon arriving in that country where the weary shall be at rest.

Many other circumstances might be represented in this picture of human misery, of which I shall at present mention only two. In time of war, those who engage in the sisheries are liable to be pressed; while others, who travel from the most remote parts, without money or provisions, to earn 30 or 40 shillings in the Low Countries by harvest work, are often decoyed into the army, by stratagens which do no credit to the humanity of the age.

These virtuous but friendless men, while endea-vouring, by every means in their power, to pay their rents, to support their wives, their children, their aged parents, and in all respects to act the part of honest, inosfensive subjects, are dragged away—they know not where—to fight the battles of nations who are insensible of their merits, and to obtain victories of which others are to reap the fruits.

The aged, the fick and the helpless, look in vain for the return of their friends, from the voyage or the harvest. They are heard of no more. Lamentations, cries and despair pervade the village or the district. Thus deprived of their main support, the rent unpaid, the cattle sold or seized, whole families are reduced to the extremity of want, and turned out, amidst all the inclemencies of the winter, to relate their piteous tale, and to implore from the wretched, but hospitable Mountaineers, a little meal or milk, to preserve their infants from perishing, in their arms.

In this fituation they wander towards the Lowlands, happy to find shelter at night from the chil-

Ва

ing.

It is no wonder, therefore, that the resentments of human nature should burst forth, upon the first opportunity, against those, who, instead of labouring to mitigate their distresses, were daily adding new oppressions; till having, by those means, desolated whole districts of the country, the delusion vanished, and they found themselves under the shameful necessity of purchasing cattle and sheep to graze the deserted heaths.

This humiliating circumstance was facilitated by an event which their penetration had not foreseen. The Highlanders, who had served in the American war, being, by royal proclamation, entitled to fettlements in that extensive country, were desirous that their kindred and friends should partake of their good fortune. (9)

fortune. Some transmitted their sentiments by letters; others, returning from thence to pay a farewell visit to their native land, delivered their opinions perfonally, and all agreed in their encomiums upon the new world. They exhorted their countrymen to exchange their barren heaths for the boundless plains of America; they declaimed upon the foftness of the climate, the fertility of the soil, the abundance of provitions, the exemption from \* taxes; the opulence, ease, and luxury of the people.

These alluring descriptions had the desired effect upon the imaginations of men naturally warm, and

\* Taxation in America was hitherto fo flight as scarcely to be felt by the inhabitants; but, after the separation of those states from Great Britain, new taxes and duties were introduced, as a prelude to others which must be levied, to discharge the interest of public debts, defray the expences of the civil, military, and naval essablishments, and other national purposes, to which every state, however small, is subject.

These remarks are inserted, in this place, chiefly for the information of those classes of men, who being ignorant of the political revolutions which have lately happened in the western world, and the heavy burdens which must unavoidably be laid upon every individual, may still be allured, by specious descriptions, to abandon their native land.

More powerful arguments against emigration remain to be mentioned. The foil of those infant states is in general very productive; but, it is well known, that the fudden transitions from extreme heat, to extreme cold; the long fogs, extensive marshes, and excessive rains, produce a train of diseases very fatal to British constitutions; besides the almost incessant stings of Musketos-and other infects, peculiar to America, during the summer months.

The only provinces exempted from taxation, are Canada and Nova-Scotia, which still compose a part of the British empire, enjoying all the benefits of its protection, commerce, laws and conflitution; but those countries are covered with frost and snow from November till April, which oblige the inhabitants to dress in skins and furs, and cut off all communication between Canada and Europe during seven months in the year. Whoever, therefore, prefers America to the temperate, wholesome climate of Great Britain, will find themselves greatly disappointed; and even the Highlands of Scotland may, with a little assistance, be rendered a more desirable place of residence to its natives, than any part of the American liemisphere.

impatient

impatient of injuries. The Highlanders now first began to look on their native country with contempt, and upon their oppressors with indignation.—Shall we, said they, remain in these miserable huts, the objects of derision, without the common necessaries of life, or the prospect of better times? No! we will depart to the great country beyond the ocean, where our labour will be rewarded, and our families comfortably maintained.

Such was the language, and fuch the disposition of the oppressed, the much-injured Highlanders, whether fituated upon the continent, or amongst the islands. In vain, did the landlords use the most perfualive arguments, offering terms, which formerly would have been gladly accepted. The heroic exploits of their ancestors, the antiquity of the clan, the respect for the chief, no longer held the people in fetters. They began to think, and to act for themfelves. Whole groups of men, women and children, passed in continual succession, to the sea ports; and with fuch determined resolution, that those who could not pay for their passage, sold themselves to the captains who were to transport them to the new world; and were, by these captains, re-sold upon their arrival at the intended ports.

The Americans beheld this inundation of Britains with astonishment, mixed with contempt of that government, which thus permitted a continued drain of its inhabitants; while the looks, the dejection, the poverty and the tattered apparel of these unhappy wanderers, touched their feelings, and called forth the exertions of humanity. They could scarcely believe, that a people, whose valour they had so recently extolled, whom Wolfe admired, and whom Chatham applauded, should be reduced to the sad alternative of perishing at home, or embarking with their families, on a voyage of 3000 miles, upon the hope of finding that relief in a strange land, which

their native and highly favoured island had denied them.

Thus, what Britain lost, America gained; and it was not long before those very men became the involuntary instruments of punishing the neglect of a country, which hath within itself the means of suftaining a more numerous population.

It is difficult to afcertain what districts have suffered most by emigration; but certain it is, that between 1763 and 1775, above 20,000 people abandoned their habitations, besides great numbers from the Lowlands; and there is reason to believe, that in a few years more, the whole Highlands would have been nearly depopulated, except those districts under the paternal care of an Argyle, an Athole, a Breadal-

bane, and a few other patriotic chieftains. But while the rage of emigration was thus depopulating the North, an order of Congress shut up the ports of America, and prohibited, under severe penalties, all intercourse with Great Britain. To this singular event, more than to the fostering hand of government, is owing the detention of those people, whose calamitous situation hath been the subject of the foregoing pages, and whom to retain at home by suitable encouragement, will be the subject of what sol-

# The Manners of the Highlanders in former Times.

lows.

When a barren country is suffered to remain in a state of nature, without arts, manufactures and commerce, the inhabitants, impelled by the irrestitible demands of hunger, seize the cattle and sometimes the corn of the more fertile plains, which they consider as lawful prey, without ever reslecting on the distresses which they thereby bring on the injured proprietors.

To fuch causes were owing the frequent irruptions of armed Highlanders upon the Low Countries, to which they proved a continual terror, notwithstanding all the spirited efforts of the Scottish princes to check their predatory inroads. Their mountains not affording them the means of subfishence, and being utterly unacquainted with the arts of civil life, they partly lived by plunder and the spoils of the unprotected frontiers. Having concerted the plan of operations, they issued forth in the night time, slept amidst the heaths and rocks through the day, and thus reaching the scene of agion, while mankind were at rest, they drove off the cattle and sheep into the defiles and labyrinths of the mountains, far beyond the reach of pursuit, with any prospect of success, or personal fafety.

Those habits having been handed down from father to son, were considered as laudable industry, the incumbent duty of the young and the brave, the atchievements of valour, by which lovers recommended themselves to the favour of their mistresses; and so far were the Highlanders from having any idea of criminality in such practices, that prayers were made to Heaven for success to every intended enterprize, and for the safe return of those who were to embark in them. The parent who could not bestow much dowry with his daughter upon her marriage; consoled the bridegroom with the produce of the next full moon, and thus he portioned off his family \*.

\* "The law hath come the length of Rossshire," said one neighbour by way of news to another; "O ho!" replied he, "if God doth not stop it, you will soon have it nearer home." Every clan had however laws of their own enacting, to which they paid implicit obedience. These laws were sew and general, and strongly mark the simplicity of rude ages. The marches of the barons or chiefs, were fixed in the presence of two or more sagacious men, and two young lads were whipped with thongs of leather, that they might the better remember the transaction. Criminals were often suffered to fast for several days, and afterwards killed with a surfeit.

Such

( 13 )

Such were the manners and modes of life in the Highlands, so late as the year 1748, when the legislature wifely diffolved the feudal tenures, broke the authority of the chieftains over their vassals, and vested the produce of the forfeited estates in trustees, for the establishment of charity schools, and civilizing the people. The beneficial effects of these meafures greatly exceeded the expectations of those who had proposed them; insomuch that, throughout the annals of mankind, there is scarcely an instance of a great body of people having been reclaimed fo rapidly, from ferocious barbarianism to inosfensive, peaceable subjects. The transition was almost instantaneous, and strongly marks the discernment and good sense, of the inhabitants, as well as the pious, indefatigable labours of the few clergymen who were appointed, upon very slender salaries, to reclaim their manners, to superintend their morals, and to enforce, by precept and example, obedience to divine and human laws.

Thus far, the legislature were entitled to the tribute of applause; but after having made a successful beginning in the great work of provincial reformation, they at once abandoned the Highlanders, civilized indeed, but otherwise in a more distressful situation than while under the immediate controll of their chieftains. No villages, magazines, or harbours were formed, or manufactures introduced, by which the people might be usefully employed, and a permanent, valuable colony established. Succeeding administrations have feen, and acknowledged, their fidelity and importance; but have taken no effectual steps to meliorate their distresses, to reconcile them to their inhospitable shores, to give protection to the injured, bread to the hungry, employment to the industrious; nor hath the smallest ray of hope been held out, whereby they might expect to see better days! On the contrary, it feems to be a political maxim with many persons, that the Highlands of Scotland are

The Character of the modern Highlanders, and their qualifications for the arts of civil life, as well as those of war.

THE Highlanders have in all ages been renowned for bravery and fidelity, in the cause which they espoused: strongly attached to their families, their chieftains and country, for whom they braved all dangers, and endured every kind of hardships. At present that barbarous ferocity, which was the offspring of feudal institutions, is completely extinguished; while their native valour, and military character, remain unimpaired. They are intelligent, hospitable. religious, inoffensive in their manners, submissive to fuperiors, temperate, frugal, grateful, obliging, honest and faithful. A man may travel in perfect fecurity from one extremity of the Highlands to the other. without taking any precaution whatever in defence of his person or property. Wherever he goes, he meets with a civility, modesty, and hospitality, which would do honour to the most polished nations; wherever he reposes any confidence, he discovers an attachment and difinterested readiness to oblige, which more opulent subjects, can scarcely conceive in idea. These qualities are the universal theme of travellers

of whatever nation, who have lately visited the Highlands of Scotland \*.

To fum up the whole, they are a hardy, brave race of men, equally qualified for the domestic, the naval, and military line; nor is there an instance amongst them, of cowardice, treachery, or slinching, during all the dangers and fatigues of the prefent and former wars, wherein they have bore a confiderable share. "I trusted, exclaimed Lord Chatham in parliament, to the mountains of the north, to carry on the most extensive war in which England had ever been engaged." This was the declaration of the ablest, most impartial and disinterested minister of the age; one who had penetration to discern, can-

\* This character of the Highlanders may, by some persons, be confidered as too flattering; but, upon confidering it over and over, I cannot, in justice, retrench a fingle word. It is the language of truth, inserted as a memorial of virtues which do honour to the pre-

fent age, and are worthy the imitation of posterity.

In rapid marches and sudden attacks, the Highlanders are unequalled. During a long march, a regiment of these men keeps up with the cavalry. If a distant coast is invaded, or a post in danger, the Highlanders are collected at an hour's notice: they fet off, and continue their march with incredible swittness, leaving all other troops, panting and breathless, far behind. The French memble at the fight of them, calling out, the English lions!

A striking instance of their sidelity happened after the battle of Culloden, when the young Pretender found fafety during fix months amongst these people, though personally known to some hundreds of the lowest ranks, and a reward of thirty thousand pounds had been offered to any person who would deliver him up.

"Kindness and hospitality possess the people of these parts. We scarce passed a farm but the good woman, long before our approach, fallied out and stood on the road side, holding out to us a

bowl of milk or whey." Pennant.

"It need not, I suppose, be mentioned, that in countries so little frequented as the Islands, there are no houses where travellers are entertained for money. He that wanders about these wilds, either procures recommendations to those whose habitations lie near his way, or, when night and weariness come upon him, takes the chance of general hospitality. If he finds only a cottage, he can expect little more than shelter; for the cottagers have little more for themselves; but if his good fortune brings him to the refidence of a gentleman, he will be glad of a storm to prolong his Johnson.

dour to acknowledge, and honesty to reward real merit: whose elevated mind knew no distinction of country or people; no narrow partialities; but, in every respect, was eminently qualified for the great purposes of uniting, more closely, this wide extended empire; by a generous diffusion of reciprocal benefits and privileges, throughout the various branches of which it was composed.

Till the days of that great man, the intrinsic value of the Highlanders, like the diamond in the mine, remained in obscurity; some obstructions removed, they shone for h at once a tractable, useful people, who might one day prove a considerable acquisition to the commerce, as well as the internal strength of Britain.

Such being the character, manners, and importance of the Highlanders, in their civilized state, a minute review of their country and shores properly follows. Should these be found irreclaimable, or incapable of answering any valuable purpose to the inhabitants, and the community at large, it would be humane, and also good policy in government, to open an asylum, in some other part of the island, for the overslow of these truly valuable people, instead of driving them, by hundreds, across the Atlantic ocean.

On the contrary, should the three hundred islands, and the extensive line of coast upon the mainland, their numerous bays, lakes, and rivers, be found capable of being rendered the bulwark of our island, on that side; the great nursery of hardy seamen and soldiers, to defend our settlements abroad; the chief repository of sish, to supply the wants of the labouring people, and to extend the scale of commerce; should these, and other objects, prove the certain consequence of parliamentary attention; it is to be hoped that government will take that business into consideration, before America shall again open a door for the dislatissied, from all parts of Britain, but more especially for these hitherto neglected mountaineers.

Comparative

Comparative state of the Highlands, and the northern countries of Europe, in respect of towns, commerce, and navigation.

IF we take our stand at the south west extremity of Cantire, and look northward, along the double coast of the continent, and the Hebride islands, towards the Pentland Firth, we shall perceive no towns, markets, storehouses, granaries, manufactures, commerce, or shipping of any sort \*. If we extend the view from Cape Wrath eastward to Dungsby-Head, and from thence southward to the Firth of Cromarty, we shall perceive a few places, dignisted indeed with the high-sounding appellations of royal boroughs, but which, in reality, are nothing more than ruinous villages, exhibiting all the symptoms of decay, poverty, and distress †.

Climate and soil, it hath been admitted, are greatly against that country; but this circumstance, instead of discouraging government, ought to excite the most speedy, vigorous measures, towards such objects as nature points out to be both practicable and expedient.

Every member of the British parliament knows, that the countries of Europe which lie under the same latitudes as the Highlands of Scotland, and even beyond these latitudes, every where exhibit the strongest proofs of public attention. Those countries have, by dint of art, been rendered the seats of industry, and a happy mediocrity of fortune, which en-

† These are Wick, Dornoch, Tain, Dingwall, and Fortrose.

<sup>\*</sup> The village of Stronaway in Lewis excepted, where some Dutch samilies had been settled, but were unfortunately driven away during the Dutch wars in the last century. These industrious people, during their short stay, extended the sisheries, and established a petty navigation, both of which have been kept up, in some degree, by the natives, who can boast of more shipping than the whole west Highlands united; it consists of three or sour small sloops or brigs, which are profitably employed in the sisheries, to the great benefit of the whole island.

ables the great body of the people to live comfortably, under severities of climate, which a Highlander can scarcely comprehend in idea.

They abound in large mercantile cities, and in capacious harbours; the works of incredible labour and expence; in vast sleets of ships, and the various produce of the four quarters of the globe; as

The climate of those countries admits of two seafons only, viz. the summer, which begins in May, and ends in September; and the winter, which instantaneously binds up the earth in one continued frost, shuts up the ports, and covers land and water with frozen snow, on which all manner of travelling is performed by means of sledges. In this season the inhabitants dress in surs or skins, which, however, do not prevent the frequent loss of hands or limbs, through the intenseness of the cold \*.

\* 66 Whenever, fays Maupertuis in his journey through the northern parts of Sweden, we would taste a little brandy, the only thing that could be kept liquid, our tongues and lips froze to the cup, and came away bloody: in a cold that congealed the fingers of tome of us, and threatened us with still more dismal accidents. If we opened the door of a warm room, the external air instantly

It is therefore to the attention of their respective governments, more than the advantages of nature, that so many commercial cities have gradually arisen in the north of Europe, within the space of a few centuries, and that places hitherto obscure are daily increasing in wealth and magnitude.

With those cities may be enumerated the Seven United Provinces, a country, which, though situated in more southern latitudes, furnishes no material articles for commerce, and scarcely a sufficiency of grain for home consumption. In extent of territory, those Provinces do not exceed the Hebride Isles, and their winters are more severe. But such is the influence of an active, vigorous government, on manufactures, commerce, and population, that the Seven Provinces contain 113 cities, 1400 towns and considerable villages, and upwards of two millions of inhabitants.

This swampy country produces no raw materials for manufactures; yet the inhabitants are continually engaged in fabricating an endless variety of articles for fale at home and abroad. They have no minerals, metals, or timber; yet their yards and warehouses are ever prepared to supply the demands of Europe, and both the Indies, in those articles. The coast is extremely dangerous, and the harbours are few; their shipping is however to be found in all the maritime parts of the world, while their own ports are the grand emporiums of European navigation. Their shores afford little or no fish for exportation, but they nevertheless forestal the European markets in those fishes which are in most esteem. They owed their first rise to the herrings taken on the coasts of Scotland, which they exported to all parts of Europe; bringing in return the produce of those nations, and

converted all the vapour in it into fnow, whirling it round in white vortexes. It we went abroad, we felt as if the air was tearing our breaft in pieces. At the beginning of June, winter vielded up the earth and sea; and we prepared for our departure to Stockholm."

thus gradually became the greatest mart in the known world.

It is to the influence and example of these industrious people, that I am enabled to give two instances. nearer home, of the benefits refulting from a proper

attention to commerce and the fisheries.

Kirkwall, capital of the Orkney islands, though fituated a hundred miles north of the medium degree of the Hebrides, contains above three hundred houses, most of them built of stone and lime, slated, and accommodated with kitchen gardens. The gentlemen also have good houses on their estates, and enjoy most of the conveniencies of life, in considerable abundance. The farmers are, for the most part, better lodged than those on the continent, or the Hebrides. The inhabitants of Kirkwall export some grain, malt, meal, beef, butter, feathers, skins of calves, otters, and feals; herrings, kelp, linen varn and cloth, fine worsted stockings, and coarse woollen goods.

By means of these articles, they traffic with the Dutch, Swedish, and other busses which frequent their coasts, during the filling seasons, when Kirkwall hath all the appearance of a continued fair. The inhabitants also carry on a small commerce with Edinburgh, Newcastle, London, Norway, Hamburgh, Spain, and Portugal, thereby supplying themselves with a variety of necessaries, and a small balance in

One degree further north, are the Shetland Isles. still less indebted to soil and climate. Here the shortest day does not exceed five hours, and the winters continue till April, during which feafon the winds are fo high, and the fea is fo agitated, that those islands are almost inaccessible for several months, when the natives are cut off from all intercourse with the world. Yet, even here, in lat. 60. 8. and amidst barren rocks, stands the town of Lerwic, containing upwards of three hundred handsome houses, and is every year increasing.

( 21 )

increasing. In the neighbourhood, there are above a hundred gentlemen's families, lodged in strong, well-built houses, commodiously furnished, and whose tables are well supplied. These islands being also much frequented by the Dutch, Swedes, &c. carry on a considerable trade with those people, and some foreign commerce similar to that of the Orkneys.

Thus the northern rocks of the Orkney and Shetland isles, animated and instructed by the Dutch, presume to trade with London, the Baltic, and the Mediterranean; while the more extensive and southerly islands of the Hebrides, and the whole western coast of the continent, are not masters of a single town, manufacture, or decked vessel, those of Stronaway in Lewis excepted. The Orkneys contain one provincial synod, three presbyteries, twenty-eight parishes, and eighteen ministers. In Sky, one of the Hebride islands, double the fize of all the Orkneys, there are only feven parishes, and three houses that are flated. As a conclusion to this comparative review, it may be remarked, that the town of Kirkwall in the Orkneys is rated higher in the tax roll, than all the towns of the Highlands united.

# The Produce of the Highlands by Sea and Land.

Throughout the globe, Nature seems to have diftributed her favours with a very impartial hand. To some parts, she hath assigned mildness of climate; to others, luxuriancy of foil, the precious metals, valuable timber, or the riches of the ocean. If we except the frozen extremities of the earth, towards the poles, her gifts will be found admirably adapted to the various species of the animal creation, particularly man, who holds the highest rank in nature, and who fancies himself entitled to the unlimited use of whatever it contains. In conformity to this universal law, those districts of Scotland, called the Highlands, though little indebted to climate and foil, abound in riches, C 3

which put them upon an equality with the most fertile regions of the world. Gold, filver, wine, spices, and the finer fruits, they have none: but the produce of the Highlands; of their seas, lakes, bays, and rivers; may, with proper management, obtain an influx of those valuable articles, and whatever is neceffary for the support and comfort of life.

Grain is raised, though at present with much difficulty, su licient to maintain one third of the people; and, whenever the more fertile parts shall be inhabited by men of property, and knowledge in agriculture, the harvests will be earlier, the autumnal rains partly avoided, and that valuable article of life greatly increased. The unexpected success in the Low Countries, of late years, should at least induce the people in the Highlands, to try the same experiments,

Roots, vegetables, and common fruits, being less hurt by the rains, can be raised in any quantity; their potatoes and turnips, in particular, are more delicate, and pleasant to the taste, than those of England, Flax is raised in tolerable plenty, and might be improved: hemp, in great abundance, and in high perfection.

Small, but hardy horses, admirably suited to the labours of that rugged country, and which require little support. They run wild among the mountains till they arrive at a proper age for labour, when some thousands are annually driven to the fouth, chiefly to the coal-pits at Newcastle.

But the abovementioned articles are only secondary considerations to the immense numbers of small black cattle which this country fends to the fouth, some of them as far as the county of Norfolk, where, after being fed in rich pastures, they sell at a high price, It is by the breeding of cattle, that farmers inhabiting the interior country are enabled, in good feasons, to pay the high rents imposed on them; but this species of property is, in the Highlands, so precarious, as sometimes to involve whole districts in one general scene of distress.

23

These indigent people are materially affected, whether the cattle die through want, or fall in their price, which is always regulated by the English markets. In either of these cases, the farmers, having no other resources, are under the melancholy necessity of removing elsewhere for support. The fize, and condition, of the Highland cattle might be greatly improved, by the introduction of clover, ryegrass, lucerne, and turnips, for winter provision; as lately practifed in the Low Countries, with great success.

Sheep \*, goats, various species of deer and game, abound in the Highlands; also water-fowl, in such immense quantities, that it is difficult to give credit to the accounts which have been given of them by modern, as well as ancient writers, who have visited the Hebrides ...

The

\* See directions for the rearing of sheep, in the appendix,

† They are thus described by the Rev. Mr. Macauly, who was appointed missionary, by the general Assembly of the church of Scotland, to the island of St. Kilda, a rock of three miles in length, and furrounded by fundry lesser ones.

"These rocks are in summer totally covered with solan geese and other fowls, and appear at a distance like so many mountains covered with fnow. The nests of the solan geese, not to mention those of other fowls, are so close, that, when one walks between them, the hatching fowls on either fide can always take hold of one's cloaths, and they will often fit until they are attacked, rather than expose their eggs to the danger of being destroyed by the sea-guils; at the same time an equal number fly about, and furnish food for their mates that are employed in hatching; and there are, besides, large flocks of barren fowls of the different tribes that frequent the rocks of St. Kilda.

"The folan geese equal almost the tame ones in size. The common amusements of the herring-fishers shew the great strength of this fowl. The fishers fix a herring upon a board which has a fmall weight under it, to fink it a little below the surface of the sea: the solan goose, observing the fish, darts down upon it perpendicu-Iarly, and with fo much force, that he runs his bill irrecoverably through the board, and is taken up directly by the fishers.

The western coasts of the continent, particularly the banks of the lakes, are generally fringed with natural woods, rising beautifully from the shores towards the summits of the mountains. These woods, some of which are twenty miles in length, are composed of oak, chesnut, ash, elder, elm, aspine, hazel, larches, pine, and sir. In some parts of the interior country, as Brae Mar, the pines are from ten to twelve feet in circumference, and from sixty to ninety seet in height, without a collateral branch; their age, two centuries.

Nor

The folan geese repair to St. Kilda in the month of March, and continue there till after the beginning of November. Before the middle of that month, they, and all the other sea-fowls that are fond of this coast, retire much about the same time into some other favourite regions; so that not a single fowl belonging to their element is to be seen about St. Kilda, from the beginning of winter down to the middle of February. Before the young solan geese sly off, they are larger than their mothers, and the fat on their breasts is sometimes three inches deep. Into what quarter of the world these tribes of wild sowl repair, after winter sets in, whether into the northern ocean, the native country and winter quarters of herrings, in general, or into some other region near the sun, or whether they be of the sleeping kind, they who pry into the mysteries of natural history, or have conversed much with writers of voyages, can best explain. I shall only pretend to say, that these different nations of the feathered kind are taught to chuse the properest habitations and feeding-places, and to shift their quarters seasonably, by the unerring hand of God.

"From the account given above of the multitudes of sea-sowls that seek their food on this coast, we may justly conclude, that there must be inexhaustible stores of fish there. Let us for a moment confine our attention to the consumption made by a single species of sowls. The solan goose is almost insatiably voracious; he slies with great force and velocity, toils all the day, with very little intermission, and digests his food in a very short time; he discains to eat any thing worse than herring or mackarel, unless it be in a very hungry place, which he takes care to avoid or abandon. We shall take it for granted, that there are 100,000 of that kind around the rocks of St. Kilda; and this calculation is by far too moderate, as no less than 20,000 of this kind are destroyed every year, including the young ones. We shall suppose, at the same time, that the solan geese sojourn in these seas for about seven months of the year; that each of them destroys sive herrings in a day; a substistance infinitely

( 25 )

Nor is it in natural woods only that the Highlands excel. While the sturdy oak and the hardy pine, wave their branches over impending precipices, deriving vigour and strength from the boisterous elements of that climate, the vallies and narrow glens underneath give protection and sustenance to planta-

tions of a more delicate quality.

At Taymouth, the feat of the earl of Braedalbane, there is a double row of straight lime trees, whose branches, at the height of eighty feet, unite so closely, and with such regularity, as to form one of the most magnificent arches in the world. This associations effort of nature assisted by art, is, however, lost amidst extensive plantations, containing many millions of trees of various species, and all in the utmost perfection. The Tay, which glides gently through this valley, is almost hid from the eye, while the losty hills on each side exhibit a view which associates every beholder. These were the works of the late earl of Braedalbane, who thereby set an example worthy the imitation of sall those who wish to improve their lands, and ornament their country.

poor for so greedy a creature, unless it were more than half supported at the expence of other sishes. Here we have 100,000,000 of the sinest sish in the world devoured annually by a single species

of the St. Kilda fea-fowls.

"If in the next place it be considered, that much the greatest part of the other tribes have much the same appetite for herring, and pursue it from place to place, in the several migrations it makes from one sea to another, the consumption must be prodigiously great. Taking these into the account, and allowing them the same quantity of food, and of the same kind, by reason of their vast superiority in point of numbers, though their stomachs are considerably weaker; we see there are no less than 200,000,000 of herrings swallowed up every year by the birds of a very small district of rocks, which occupy so inconsiderable a space in the Ducaledonian ocean.

"Should all the articles of this account be fustained, articles which feem no less just than plain, and should our curiosity lead us into a new calculation, allowing between fix and seven hundred to every barrel, it is evident that more than 330,000 barrels are

annually carried away by fuch creatures."

Contiguous

Thus, in a country where nature hath denied the means of successful agriculture, that kind parent points out to the inhabitants a progressive, inexhaustible source of wealth, which cannot be injured by unpropitious seasons, the events of war, or the revolutions of empire. Nor doth it require the expence. and labour fo necessary for the raising of those scanty crops of oats and barley, which neither enrich the landlord, nor supply the wants of the tenant. On the contrary, a gentleman felects the most barren tracts of his estate; rocks, sands, gravel, and other waste grounds, unfit for agriculture or grazing. On these wilds, he plants a million of firs, pines, and larches; which, at the expiration of thirty years, will bring, upon the lowest average, and in the most remore fituations, one shilling each, or 50,000 f. for the whole; and when arts and commerce shall be introduced into these parts, the value will be doubled, as appears from recent inflances in the neighbourhood of trading towns, where trees of this age have brought from one shilling and fix pence, to three shillings each.

Few gentlemen in Scotland are unacquainted with the value of that small species of oak, which grows spontaneously upon the hills and rocks. The bark supplies the tanner, the net, and sail-maker; the wood is consumed in various works of glass and metal. These oaks are cut down every 20 or 25 years. The price is regulated by the demand; and the demand, by the progressive state of arts, manufactures, and commerce, in these kingdoms: consequently the value of this timber is continually advancing, insomuch that a wood, which would bring only 1000 £, twenty-five

years ago, now fells at 1500 f.

This branch therefore, opens a new field of action to all those who have wisdom to avail themselves of it. By thus attending to such objects as nature dictates to be both practicable and profitable, the Highlands will become an immense forest, enriching the landlords, and giving employment to the hitherto starved commonality, in the various occupations of enclosing, planting, cutting down, peeling off the bark, sawing and transporting both timber and bark, to distant markets.

It is well known that Norway, a country bound up in frost and snow nine months in the year, loads several hundred vessels annually with masts, planks, and

deals, the produce of the fir \*.

In England, the full grown oak, and other timber, constitute a considerable portion of the landed property of that kingdom. The lesser timber is sold in faggots, or by the cart-load, and used for a variety of purposes. The large trees, many of which bring five pounds and upwards, are conveyed to the capital and elsewhere, by an incredible number of barges which navigate the rivers and canals, besides the cargoes, sent coastways.

But these supplies, though great, are far from answering the demands of a kingdom, whose villages are rising to the magnitude of cities, and where the shipping is continually upon the increase. The forests of Norway, the Baltic, Germany, and North America, load many hundred large ships annually for the British ports, though burdened with insurance and high freight, which must unavoidably enhance the price +.

Here

<sup>\*</sup> The method of raising oak and fir to full maturity in Scotland, will be found in the Appendix.

The timber imported from Holland, Hamburgh, and the Baltic, comes chiefly from the interior parts of Germany, Poland and Russia.

Here therefore the produce of the Scottish mountains and vallies will always find a good market, and an inexhaustible vent. Instead of a petty traffic from one island to another, in little open boats, these western shores will contribute their quota to the supply of the capital, in timber, slate, lead, and sish; while that city will, in return, supply the necessary wants of those shores; thus opening new channels of commerce and navigation to the mutual benefit of individuals, and giving, at the same time, additional strength to the British navy.

Copper hath been discovered in the Highlands of Scotland; iron stone is found in many places; and lead mines have long been wrought with success.

Some islands, as Esdale, and others in its neighbourhood, are composed entirely of slate; besides numerous quarries on the main land, which, from the want of commerce and towns, cannot be brought into use.

The island of Lismore, eight miles in length, is one continued rock of limestone. Ross-shire and Sunderland, abound in mountains of marble resembling the Parian; but this treasure is of no benefit to the proprietors, on account of the distance from water carriage, and the almost uninhabited state of those remote regions.

Freestone, granite, marle, silver fand, shells, kelp, potters clay, fullers earth, and fern, are common throughout the Highlands.

Rivers and inland lakes are extremely numerous in the Highlands; they contain falmon, trout, char, eels, poans, and other delicate fishes; and, as it is well

Russia, by means of large rivers, and is become both scarcer and dearer of late years, as appears from the report of sundry merchants and builders, to the House of Commons, from which some extracts are given in the Appendix. The coasts of America begin also to feel a scarcity of timber; what we now receive from that country is brought down the rivers in floats to the ports, from whence there is a voyage of 3000 miles. All these circumstances are in favour of British timber.

known that fish may be transported from one country to another with success, these lakes might be rendered of still greater utility. The Chinese pedlars carry on such business throughout the various provinces of that extensive empire.

In Switzerland, a country refembling Scotland in the magnitude of its mountains, and the number of its fresh-water lakes, there are one or more towns on each; and, says bishop Burnet, it is generally computed, that an eighth part of the inhabitants live by the produce of their fishing. Mr. Ray observes, that in the lake of Zugh, which is not very considerable, there are at least fifty different species of eatable fish, all in great plenty, and some of the most delicate

forts, fuch as trout, grayling, char, perch, and others, most of which had been brought thither from distant parts.

The possibility of transporting fish being thus established, the Scottish lakes might be stocked with the streamling, an excellent fish in the Swedish lake Maeler; the rheinlacker, or Rhine salmon, which is two ells in length, and forty pounds weight, from the lake of Constance in Switzerland; also the large trout, weighing thirty pounds, which is found in some of the northern parts of Scotland, as well as the lake of Geneva. But all the above enumerated articles, though they might be rendered extremely savourable to commercial purposes, are lost in the comparison with the riches of the seas, which environ the Highlands of Scotland.

Through the openings, between the bases of the mountains, slows the great Western Ocean, in various directions, forming one continued succession of bays and lakes, from five to sifty miles within land; which, with the sounds and channels, formed by the Hebride islands, and the banks interspersed upon these shores, contain the greatest repository of sish hitherto discovered in any part of the known world, and of excellent qualities. The most useful are turbot,

ling, haak, tulk, sturgeon, HERRINGS, whitings, haddocks, skait, soals, phinocs, mackarel, salmon, trout, char, pike, eels, and poans; various species of shell sish, as lobsters, oysters, crabs; also all kinds of cetacious sish, from whales of every denomination down to the grampus; seals, sea-dogs, and other amphibious animals, which frequent the caverns, in great abundance.

Of all these fishes, the herring is the most important, not only on account of the vast shoals which annually present themselves in the Deucaledonian ocean, but also their superior quality, in those parts, as appears from the various descriptions given of them by Sir Walter Raleigh, Sir William Monson, and other writers of the last and present century. Of these accounts, that given by the judicious and worthy Thomas Pennant, Esq; seems to be the most fuitable to the present subject. "Loch Broom," says he, "has been celebrated for these three or four centuries as the refort of herrings. Those that turn into this bay are part of the brigade that detaches itself from the western column of that great army that annually desert the vast depths of the Arctic Circle, and come, heaven directed, to the feats of population, offered as a cheap food to millions, whom wasteful luxury, or iron-hearted avarice, hath deprived, by enhancing the price of the wonted supports of the poor.

"The migration of these sish from their northern retreat is regular: their visits to the western isles and coasts, certain: but their attachment to one particular loch, extremely precarious. All have their turns; that which swarmed with fish one year, is totally deserted the following; yet the next loch to it be crowded with the shoals. These changes of place give often full employ to the busses, who are continually shifting their harbours in quest of news respecting these important wanderers.

" They

(31)

They commonly appear here in July; the latter end of August they go into deep water, and continue there for some time, without any apparent cause. In November they return to the shallows, when a new sishery commences, which continues till January. At that time the herrings become full of roe, and are useless as articles of commerce. Some doubt, whether these herrings that appear in November are not part of a new migration; for they are as fat, and make the same appearance, as those that compose the sirst.

"The figns of the arrival of the herrings are flocks of gulls, who catch up the fish while they skim on the surface; and of gannets (Solan geese), who plunge and bring them up from considerable depths. Both these birds are closely attended to by the fishers.

"Cod-fish, haddocks, and dog-fish, follow the herrings in vast multitudes: these voracious sish keep on the outside of the columns, and may be a concurrent reason of driving the shoals into bays and creeks. In summer they come into bays generally with the warmest weather, and with easy gales. During winter the hard gales from N.W. are supposed to affist in forcing them into shelter. East winds are very unfavourable to the fishery.

The enemies that affail these fish in the winter season are varied, not diminished: of the birds, the gannets disappear; the gulls still continue their persecutions; whales, pollacks, and porpesses are added to their number of foes. These follow in droves; the whales deliberately opening their vast mouths, taking them by hundreds. These monsters keep on the outside; for the body of the phalanx of herrings is so thick as to be impenetrable by these unwieldy animals."

HITHERTO the inhabitants of these neglected shores, unable to avail themselves of the bounty which their seas afford, have lived in penury, amidst the sources of affluence; I shall therefore specify such measures as seem most conducive to the purposes of general utility, in the sull establishment of a populous, thriving colony.

The first object which presents itself is the opening shorter communications between the Atlantic and the British Sea; the advantages of which are so obvious, that they may be considered as the groundwork of all succeeding improvements, not only in the

Highlands, but over Scotland in general.

That nation admits of three artificial navigations:
1. The Southern navigation, between the Forth

and the Clyde.

2. The Western navigation, between the Clyde or Loch Fyne, and the Atlantic.

3. The Northern navigation, between Fort William and Inverness.

Navigation between the Forth and the Clyde.

SCOTLAND is almost divided into two parts, by the rivers Forth and Clyde. The Forth falls into the British Sea below Edinburgh, and has an easy communication with the whole eastern coast of Great Britain; with France, Ostend, Holland, Hamburgh, Prussia, Dantzic, Russia, Sweden, Denmark, Norway, and Greenland. The Clyde falls into the Atlantic Ocean below Glasgow, and communicates with the western coast of Great Britain; with Ireland, the south of France, Portugal, Spain, the Mediterranean, America, and the West Indies. These two rivers, thus falling, in opposite directions, into the two seas which environ our island, and the neck of land be-

tween them, amounting scarcely to twenty-four miles, gave rise to the idea of a junction, so as to open a communication across the kingdom, and thereby cut off the long, dangerous navigation by the Land's End, and the Pentland Firth.

An object of such general utility did not escape the notice of Charles II. who, amidst all his gallantries, was the great promoter of every defign which had the success of trade and navigation, in view. That monarch proposed to open a passage for transports, and small ships of war, at the expence of 500,000 %. a sum far beyond the abilities of his reign; and the defign was consequently laid aside. The affairs of the continent engaged the attention of fucceeding princes, till the beginning of the present reign; when the earl of Chatham, endued with all the penetration and magnanimity of an able statesman, proposed to carry the design immediately into execution, at the public expence, on a smaller scale than the original design, but still sufficient to admit vessels of burden. Unfortunately, the resignation of that great man loft, to these kingdoms, the only opportunity which Nature prefented for giving security and expedition, to the British navigation, in the northern seas.

This business being thus abandoned a second time, the late duke of Queensberry, Sir Laurence Dundas, and sundry other public spirited gentlemen, resolved to open the navigation at their joint expence, upon a scale still more contracted, but sufficient to admit wessels of 80 or 100 tuns. The work was begun in 1768; and, in 1775, it was completed to the neighbourhood of Glasgow, and within six miles of the intended junction with the Clyde.

The company's subscription was proposed to be 150,000 l. but it never amounted to 140,000 l. and many of the subscribers did not make good their payment. 150,000 l. have however been expended; the company is consequently in debt; and the remaining

not thought it expedient to raise.

As the commerce between these kingdoms hath lately encreased, and is encreasing, the completing this canal is, consequently, an object of equal concern and utility to the trading part of the whole island, and in a lesser degree to Ireland. The company might therefore be reimbursed, and dissolved; and a work, which is not local, but a general business, be executed, as originally intended, at the public expence; but should this be deemed inexpedient, the sum still desicient, or any part of it, might, with no great inconvenience, be immediately voted.

The dimensions of this canal, though greatly contracted from the original design, are much superior to any work of the same nature in South Britain. The English canals are generally from 3 to 5 feet deep; 20 to 40 feet wide; and the lock gates from 10 to 12 feet; but they fully answer the purposes of inland carriage, from one town to another, for which alone they were defigned. That, between the Forth and the Clyde, was happily constructed upon a more enlarged plan, because the distance was short, and the surface almost on a level. Its depth is seven feet, and its breadth, at the surface, sifty-six feet. The locks are seventy-five feet long, and their gates twenty feet wide. The distance between the entrance into the Clyde and Forth, is, by the Pentland Firth, 600 miles; by the canal scarcely 100; all vessels therefore, not exceeding 80 or 100 tons burden, will, by this passage, save sive hundred miles of a navigation, at all times dangerous, and in winter almost impracticable. The voyage by the Land's End is still more extensive, and in time of war doubly hazardous.

Respecting the West Highlands, for whose benefit this subject was chiesly introduced, the utility of a short passage between that country and the East sea need scarcely be mentioned. Hitherto the navigation ( 35 )

of the Highlands, and the petty traffic of the inhabitants, have not extended beyond the limits of Glafgow; but whenever these fix miles shall be completed, a new world will open to their view; the scene of action will be extended; vessels of a larger and better construction will be gradually introduced; the natives will not only take and cure all the various fishes which frequent their coasts, but also embark upon distant voyages, as occasions may require, for a market. Those men who have hitherto been excluded from foreign intercourse with mankind, who have been left to prowl amidst their boisterous shores at home, will now begin to trade with the various ports of Scotland; with London, Holland, and the Baltic, where the superior goodness of their herrings will always command a speedy sale.

## 2. Navigation between the Atlantic and Loch Fyne.

TO render the fouthern navigation still more complete, it will be necessary to shorten the passage from the Atlantic to the Clyde; or, in other words, from the Hebrides and West Highlands to Glasgow, Greenock, and other trading towns on that celebrated river. The navigation of the Highlands being greatly lengthened by head lands and other obstacles, which must be carefully avoided, we cannot estimate the voyage from Cape Wrath to Glasgow, at less than four hundred miles, or eight hundred miles outward and homeward. This is a bold undertaking for little open boats, badly constructed, and still worse provided; and if, to the great distance, we consider the almost incessant gales, the vast number of islands, lee-shores, rocks, sands, and currents, attending these voyages, we may pronounce them not only long and tedious, but extremely hazardous to the poor natives, whose necessities compel them to such desperate attempts. Nor are these the only difficulties which

 $D_2$ 

nev.

they have to encounter in their passage to Glasgow. The wind which favoured their voyage to the Mull of Cantire, becomes, consequently, adverse after having doubled that cape; they must then sunt the fail, and ply at the oars, through a heavy fea, up the Firth of Clyde, sometimes for several days, before they can reach the intended port. Having disposed of their small affortment of bark, skins, wool, and dried fish; they have, in their return, to combat the fame round of difficulties, toil, and danger; the whole trip employing four men, from three to five weeks. This traffic, however infignificant, is suspended during the winter feafon; the navigation becomes then impracticable for open boats, and the people, as hath been already observed, are shut out from all intercourse with the seats of industry, population and affluence. Such is the commerce and navigation of a people inhabiting the richest, and most improveable

The herring fishery, though an object of great importance, not only to that country, but to the West-Indies, and other dependencies abroad, labours under the same difficulties in these western seas. The busses sitted out from the ports of the Clyde must, in their outward and homeward voyages, steer round the Mull of Cantire; and, as all the hopes of the adventurers depend on a speedy sishery, and a quick sale, nothing can prove more discouraging to that national staple, than the hazard, the delay, the expence, and

the uncertainty of this circumnavigation.

In a dark, tempestuous night of January 1782, two busses, loaded with herrings, were wrecked, in their homeward passage from Loch Broom, on coming round the peninsula of Cantire. Many lives were lost; and as the crew of every vessel have generally a concern in the venture, several families were at once deprived of husbands, fathers, and property. It would be endless to enumerate the many catastrophes which befall these industrious people, in navigating

to relieve it. Another inconvenience attending this navigation remains to be mentioned. It hath already been obferved, that though the arrival of the herrings be certain, yet the particular lake or bay of their rendezvous remains doubtful, until discovered by the fowls which attend the shoals. Sometimes the herrings are discovered in Loch Fyne, and other lochs on this fide of Cantire; at other times, in Loch Broom, or amidst the Hebride islands, on the other side. In either case, the people of the one side must sail round that peninsula, before they can avail themselves of the fishery on the opposite side, and every boat, however small, must make a circuit, of at least one hundred miles, before the arrives at thores which lie parallel to the place from whence she set out. Therefore, when all these circumstances are combined and duly confidered, the expediency of a shorter navigation between the Atlantic and the Clyde, must appear obvious to every observer. It is a matter not only of national utility, but of moral obligation. It touches the feelings of humanity, and calls loudly for immediate redress.

A stranger from China, France, or Holland, would imagine that a work of such importance to a commercial nation, presented difficulties in the execution, which could not be removed at a less expense than several millions sterling; but, how great would his surprize be, when informed, that nature had almost completed the business, leaving only an isthmus of sive miles between the two seas; that the surface was perfectly level, and that the expense of joining these waters would amount to no more than 17,000 1.

 $\mathbf{D} \cdot \mathbf{g}$ 

Inc

Thus the cutting eleven miles, including the unfinished part of the Glasgow canal, would complete all the inland navigation that the fouth of Scotland requires, or admits. It would answer every valuable purpose, in that division of the kingdom, but more particularly to the Highlanders, who by finding themselves brought nearer, by one hundred miles, to Glafgow, and its communications with other parts of the island, would gradually forget the grievances which had nearly desolated their country. A voyage, which frequently takes up three weeks, would, by this easy passage, be performed in four or five days, with fewer hands, and in all feafons of the year. By cutting off the peninsula of Cantire, the voyage would be entirely inland, and happily screened, by the mountains, from the dreadful tempests of the Atlantic \*.

## 3. Navigation between Fort William and Inverness.

A THIRD, or northern navigation, of very confiderable utility, claims the attention of the public. Geographers have usually described Scotland under

two natural divisions, the countries lying south of the Forth, and those on the north side of that river. Those people, however, who have personally examined that kingdom, must have perceived that Nature seems to point out three divisions, the south, the middle, and the north.

Between the island of Mull and the Murray Firth, there is a level or chasm, composed of land and water, which separates the mountains of the middle division from those of the north, so completely, that with very small affistance from art, ships might pass between them, from sea to sea.

On the west side of this extensive valley is the Linnhe Loch, penetrating above thirty-four miles eastward, and so capacious, that ships of the line have been moored as high as Inverlochy, now known by the name of Fort William. This fine falt-water lake is furrounded with leffer ones, communicating, or which might easily be made to communicate, with it. The fish peculiar to the Linnhe Loch are herrings, white fish, salmon, trout, and phinocs, supposed to be the young of what the fishermen call the great trout, weighing thirty pounds. The timber is birch and pine. Inverlochy was, in ancient times, a residence of the Scottish kings, and also a place of some trade in fish, skins, &c. From Inverlochy, eastward, is the river Lochy, iffuing, at the distance of seven miles, from Loch Lochy, a beautiful sheet of water, fourteen miles in length, above one in breadth, and thirty fathom in depth; abounding in falmon, trout, and other fish peculiar to fresh-water lakes; the banks shaded with natural woods. Eastward, at the distance of two miles of a level, fandy ground, but without any river, is Loch Oich, a narrow, deep lake, four miles in length; the shores beautifully fringed with woods. The waters of Loch Lochy are sometimes navigable for small boats, and discharge themselves into the west sea at Inverlochy; those of Loch Oich. pavigable also for small boats, take their direction to-D 4 wards

<sup>\*</sup> As the west side of this peninsula is the great receptacle of herring and white sish, it may be supposed that a deep and wide canal through this narrow tract, would open a channel for those sishes into Loch Fyne and the Clyde.

wards the eastern shore; falling, at the distance of four miles, into the famous Lochness, a lake twentytwo miles in length, near two in breadth, and in depth from 5 to 90 fathoms. This lake hath some qualities peculiar to itself; it never freezes; and, in winter, it is covered with a steam or smoke, proportioned to the severity of the weather. It even softens the rigours of the air, and affifts vegetation, particularly trees, which, on the fouth fide, form one continued wood of birch, ash, and oak. Its waters are extremely favourable to the human constitution, and longevity. The fish are falmon, trout, pike, and cels. The furrounding woods and mountains, besides small cattle, sheep, and goats, are also frequented by wild animals, and fowl peculiar to the Highlands, as stags, roes, hares, ptarmigans, grous, and black game; also the scarce bird called the capercally, or cock of the wood. Combining all these circumstances, the n'eighbourhood of Lochness appears to have been defigned by Nature for population and commerce, by land and water. Confiderations of still greater moment remain to be mentioned.

From the eastern extremity of this lake issues the river Ness, gliding in a copious stream, through a level country of fix miles, till it falls into Loch Beaulie, a capacious falt water lake, communicating with the British sea at Ardersier, a narrow strait, guarded by Fort George. From this lake the tide flows about a mile up the river Ness, which, having a fandy bottom, can easily be rendered navigable. This river may be termed the great thoroughfare for falmon between the sea and Lochness; they are taken in vast abundance by the London fishmongers, to whom the fishery is farmed, to the great prejudice of the natives. The waters of the Beaulie are still more valuable. To the fish peculiar to inland lakes, are added the various riches of the ocean, particularly a small but well-flavoured species of herrings, which the inhabitants capture at pleasure, with very little trouble or expence.

( 41 )

The whole line of communication from the found of Mull to Inverness, comprises an extent of ninety-three miles, and is thus composed of land and water, viz.

Linnhe Loch, 34	River Lochy,
Loch Lochy,	- Oich,
Oich,	Ness,
Ness, 22	

Land, from Loch Lochy to Loch Oich; the level 14 feet above the flood mark at Inverness.

Lakes, 74
Rivers, 17
Land, 2

93

Thus, by cutting two miles of land, and deepening seventeen miles of almost navigable rivers, a direct communication may be opened between the two seas; so favourable is Nature, even amidst the wilds of the north Highlands, to provincial improvement, and national utility. In no part of the Highlands hath the spirit of emigration been more severely felt by the landholders; and, unless some inducement shall be held out to these discontented natives, that great division of the kingdom will soon be desolated.

Nor is it the Highlands only that require the aid of a communication between the two feas. The climate, along the banks of the Murray Firth, is foft, and the foil excellent, as appears from the exports of grain and meal to Glasgow, and other trading towns of the south. This country hath also many considerable woods, much iron ore, and some lead. The sea is bountiful in white sish, herrings, and salmon; but these shores, though thus abounding in the necessaries of life, labour under a natural missortune which no human efforts can remove. A ridge of hills, called the Grampian Mountains, forms an almost impassable

chain

chain from Loch Lomond to near Aberdeen. This eroffing the kingdom, from fea to fea, cuts off the northern counties from all inland communication with the fouth, during the winter; nor do the narrow, steep passes admit the carriage of goods, even in summer.

All mercantile intercourse must therefore be carried on by water carriage only; and even this mode of conveyance is limited to the east fide of the island, as Edinburgh, London, and of late to Glasgow, by means of the canal from the river Forth to, nearly, that city. The only communication, which the inhabitants of these northern shores can have with the west fide of the island, must be by the dangerous navigation of the Pentland Firth; a passage which they seldom attempt. The proposed canal would prove an effectual remedy against this inconvenience, by opening a fhort and fafe paffage to the west Highlands, the Hebrides, the Clyde, Liverpool, Bristol, and the whole kingdom of Ireland. Inverness, which is well fituated for commerce, would become the emporium of the north, a centrical port between the two feas, giving employment to the industrious, and diffusing universal comfort amongst a people whose patience is completely exhausted.

In closing this subject it may be proper to remark, that the three canals, here recommended, would open a circumnavigation, within the heart of the kingdom, to the unspeakable benefit of commerce, and the fisheries. A vessel setting out from Inverness to Edinburgh, and the east side of the island, might return by Glasgow, the Hebrides, and other parts, on the west side, and so vice versa, as might seem most beneficial to the parties concerned.

This inland navigation, amounting to about 500 miles, would include almost the whole trading part of the kingdom; a circumstance which requires the most serious attention; and the more so, when we consider with what facility it might be accomplished, and the smallness of the expence, compared to the solid and permanent

permanent advantages to the Highlanders in particular, and to the trade of these kingdoms in general, as will further appear by the following estimates:

By completing fix miles of the canal between the Forth and Clyde, by which vessels under 100 tuns would fave near 500 miles, and elude all privateers,

By cutting two miles of land, and deepening feventeen miles of rivers, between Fort William and Inverness, which would save 200 miles.

By cutting five miles between Loch Crinan and Loch Fyne, which would fave 100 17,000 miles.

Land to be cut, Rivers deepened, 13 Navigation faved, 800 miles.

The accumulated loss sustained by the tedious and hazardous passage round the Pentland Firth, in delays, damages at sea, shipwrecks, captures, extra freight, and insurance, amounts in one year only, to more than would complete the above works of general utility; and, if to this we add the great object of relieving the distresses of 400,000 people, of bringing them into the line of action, and of opening new sources of wealth and commerce within our own island, it is matter of associated long ago.

#### A Review of the Herring Fisheries.

THE whole coast of Scotland may be considered as one continued fishery; distinguished however by various names:

I. The

60,000

r. The western, or Loch Broom fishery.

2. The northern, or the Orkney and Sherland fishery.

3. That on the east side of the kingdom.

#### The Western, or Lock Broom Fishery.

The arguments already advanced respecting the distresses of the Highlands, from the want of towns, markets and granaries, will acquire considerable force from the following review of the herring sishery, the discouragements under which it labours, and the piteous situation of those who are under the necessity of following it, in the present neglected state of these townless shores.

The west of Scotland presents a coast, taken in a direct line, from the Mull of Cantire to Cape Wrath, of 250 miles; and, if to that extent, we add the head lands, the shores along the bays, and lakes, by which it is every where indented, and frequently to the depth of twenty or thirty miles within land, we may fafely estimate the whole at more than 2000 miles. But it is to be observed that the shores of this district are not confined to the mainland only. The Hebride isles, which are 300 in number, and some of them above 40 miles in length, cover the whole western continent, from one end to the other; and, confequently, present a double coast; besides the numerous feas formed by the irregular distances and directions in which the islands lie. If, therefore, we were to particularize the circumnavigation of each respective island, with its bays and lakes, and sum up, in one view, the whole extent of those seas, destined by nature for valuable fisheries, it would be found to exceed the whole coast of the European continent, from the Baltic to the Mediterranean.

Hitherto this boundless source of national wealth hath been conducted under such distressing circumstances as are shocking to humanity. The summer fishery

( 45 )

fishery is tolerable, but nothing can equal the horrors of the winter's scene. The busses set out in October, and have to cruize throughout this vast Archipelago, amidst storms, or heavy gales, till the shoals have been discovered, frequently at the distance of more than 200 miles from the places whence the vessels took their departure; and, however incredible it may appear, the busses are accompanied, in all these dangers and difficulties, by the poor natives in their little open boats, though barely able to keep upon the surface of the wayes.

The fishery is performed in the night time, by the boats belonging to the respective vessels, and the natives: the success is generally proportioned to the roughness of the sea. The herrings are commonly sound amongst the bays, or lakes, whose barren and thinly inhabited shores afford no comfort, either to the weary, or the sick. The situation of those who are employed on shore, in gutting the herrings, for the small pittance of three halfpence per barrel, is, if possible, still more calamitous. This branch is performed by women and children, who travel thisher, in all inclemencies of weather, carrying on their backs the infants, the meal, the kettle, and other little matters, which the townless coast does not afford.

They, most generally, enter upon the cold business without any shelter for themselves, or their infants; without even a change in diet, from their arrival, till their departure. Here are seldom any lodgings for the sick, or the dying. The heath, the caverns, or the woody shores, are their bed; the snow, or the hoary frost, their covering.

These circumstances are not only distressing to the people, but highly prejudicial to the fisheries, which are now on the decline, and will, in all probability, dwindle to a meer name, unless speedy, effectual measures shall be taken to remove impediments, and to meliorate distresses which rested dishonour upon the boasted humanity of Britain.

The

The expence in purchasing and sitting out the busses, agreeable to the act of parliament, is very considerable. Every vessel of eighty tuns ought to have eighteen men, three boats, 20,000 yards of netting, 144 barrels of salt, besides empty casks, and stores for a three months voyage. The captain and mariners generally engross the principal shares of the venture, on which they stretch their credit to the utmost limits. Should the enterprize sail, through want of success, shipwreck, a bad market, or any other cause, the loss is severely felt, not only by those who were immediately concerned in the undertaking, but also by their friends and neighbours, who assisted in sitting them out, in the hopes of a successful sishery, to the mutual

advantage of all parties.

Such being the expence and precarious state of the herring fishery, government, to encourage this nursery for seamen, granted a bounty, of fifty shillings per tun, to all adventurers, from both kingdoms. While the bounty was regularly paid, the fishery was carried on with spirit, and promised the most solid benefits to the public, as well as individuals. But these agreeable prospects were of short duration. The bounty fell into arrears, and was withheld from year to year, till at length the payment of it, even at any distant time, became matter of doubt. Meanwhile, that useful body of men, who had embarked in these expensive undertakings upon the faith of parliament, unable any longer to pacify their creditors, found themselves reduced to the sad alternative of a jail, or, of flying to a country, which is destined to become the refuge, and asylum, of the unfortunate, the injured, and the oppressed, from all parts of these kingdoms, and of Europe.

The bounty thus injudiciously withheld, was afterwards reduced to thirty shillings per tun, but on the strongest assurances of its being regularly paid, when due. It was so for a time, when the sishery' gradually revived, and bade fair to arrive at a greater ( 47 )

height than in any former period. These favourable appearances were again checked through the non-payment of the bounty; the credulous adventurers were glad to sell out at thirty or forty per cent. loss; and a sishery which, some years ago, employed near 300 busses, besides some thousand Highlanders in their small boats, did not in 1782 employ sisty vessels, throughout the whole western coast of Scotland, and the Hebrides.

In addition to these discouraging circumstances, the salt used in curing the herrings for home consumption is liable to a duty, and even the hoops, brought from Holland, are not exempted; so that, upon the whole, government gives with one hand, and takes with the other. But this is not all; its gifts, from the injudicious delays in payment, instead of promoting the fisheries, not only defeat that important object, but contribute to deprive the country of its valuable subjects, whom it first ruins, and afterwards drives to

foreign parts.

Still more injudicious is the distinction made between British herrings sold to Ireland for re-exportation, and those for the home consumption of that kingdom. The latter is subject to a duty, which, though small, amounts to an embargo, because the Irish having a sishery of their own, free (as the country which they inhabit) from all impositions, and encouraged by their parliament, will never purchase herrings at a British market, except in years when these sish do not visit their coasts. Of the herrings exported from Ireland, it may be proper to remark that their barrel contains twenty-eight gallons only, whereas the British must hold thirty-two, under a penalty.

Respecting the natives who assist in completing the cargoes of the busses, it is to be observed that each boat contains four men, whose joint stock is far too scanty for the expence of sails, ropes, nets, &c. When

the

The fishermen, after having combated the fury of contending elements; after having, in their wander-ings from sea to sea, surmounted all the fatigues of a winter's navigation, direct their course homewards: they haul their shattered boats on shore; lodge the nets and tackling; and returning, emaciated and wore out, to their families, they confirm, by dejected looks and empty pockets, the unwelcome news; while the consideration of debts recently contracted, and which they are utterly unable to pay, gives additional poignancy to the anguish of their minds.

Were there any towns, or any encouragement for labour, on these shores, an occasional failure in the sisheries, might be repaired by industry, and the samily kept together; but in the present state of that country, the man who is unsuccessful, for one season only, is undone.

If this representation be just; if the endless distresses of these our countrymen and fellow subjects, can impress the minds of a great, a just, and a generous nation, this business will be taken into consideration, and a small gratuity or bounty to every boat, immediately granted. These boats may be registered, and put under such regulations as the legislature shall judge most expedient for the general benefit of the state. By such measures this nieful class of men will

( 49 )

be induced to remain in their native country; the number of feamen will be increased, and exactly afcertained; a grateful, high-spirited people, proud of the attention thus paid them, will, in all times of national distress or danger, be eager to rush upon the mouths of cannon, in defence of our empire, constitution, liberties and commerce.

### The Orkney and Shetland Fisheries.

BUT all the various discouragements, above enumerated, are trivial, when compared to the national loss, sustained by our permitting the Dutch, French, Hamburghers, and other foreigners to engross the greatest part of the Orkney and Shetland fisheries.

It is recorded, in the Batavian annals, that the Scots fold their herrings to the inhabitants of the Netherlands, as early as the ninth century. This traffic laid the foundation of a commercial alliance between both countries, which subsisted, to their mutual advantage, during many ages, but is at present of very little consequence. History gives us no light respecting the origin of the Dutch fisheries, which have, in latter times, been permitted on the coasts of Scotland, so very prejudicial to the commercial interests of that country. Suffice it therefore to observe, that in the estimates handed down by Sir Walter Raleigh, Sir William Monson, and other navigators of the last century, this fishery had then arrived at a height which almost exceeds credibility. Sir Walter Raleigh relates, "That, in 1603, the Dutch fold to different nations as many herrings as amounted to 1,759,000 pounds sterling. That, in 1615, they at once sent out 2000 busses, and employed in them 37,000 fishermen. That, in 1618, they fent out 3000 buffes, with 50,000 men, to take the herrings, and 9000 more vessels to transport and sell the fish; which, by fea and land, employed 150,000 men, be-

ha

sides those first mentioned. All this wealth, says he, was gotten on our coasts; while our attention was taken up in a distant whale fishery."

Sir William Monson, after taking a review of the vast commerce carried on by the Dutch, which he ascribes chiefly to their sishenies, proceeds thus; "There needs no repetition of any former relation; for truth has spoke it, which is so glorious of herself, that it needs no shade to give it better gloss: in what follows I will demonstrate by the particular proceedings of the Hollanders, in their pinks and busses, what certain gain they yearly naise out of them; and when experience, the mother of knowledge, shall make it apparent to you, I hope you will remember what you are, and how easy you may make yourselves and country by it.

"I confess this fishing is a business I have taken into confideration. My lord of Northampton, if he were now living, was able to wirness how much it was follicited and defined by me, and no less wished and defired by his lordship. But by the death of my lord, it rested unthought on by me, till the late duke of Richmond revived it, and importuned me once more to it. His death in the like manner made it die, till his majesty (Charles I.) of late, out of his princely care for the good of his loving subjects, for the renown of his kingdoms, and defire of the unity and equal benefit of his two realms of England and Scotland, took more than an ordinary care how to effect it, well befeeming to bleffed and benign a prince: and now I will descend to the particulars of the Hollanders buffes, as well in their taking herrings, as cod, and ling, and the feafons of the year for both.

"From the Texel in Holland to Brasound in Shetland, an island belonging to his majesty's dominions in Scotland, is two hundred thirty and odd leagues, whither there resort the 22d or 23d of June well nigh 2000 fishing vessels. The 24th they put to sea, being prohibited prohibited till that day, and a penalty upon the breaker thereof, holding the herrings till then unfeafonable to falt for their fatness.

"Every one of these vessels that day directs its course to find out the shoal of herrings, like a hound that pursues the head of a deer in hunting: when they have laden their busses, which is sooner or later, as they find the shoal of herrings, they presently return home for Holland, and leave their herrings ashore to be there repacked, and from thence immediately to be sent into the Sound [the Baltic], where they receive them for a great dainty.

The busses having thus disburthened themselves in Holland, once more furnished with victuals, casks and salt, they repair to sea to look out the shoal they had formerly left; and then sinding them, and silling them once again, they do as they did before, return

to Holland.

"Nor thus ceasing, the third time they repair to the shoal, as aforesaid; and in their three sishings, computing with the least, they take to the number of 100 lasts of herrings, which being valued at ten pounds the last, which is not seventeen shillings a barrel, will amount to 1000 pounds sterling each thin

"Many times this fishing fleet is attended with certain vessels called yawgers, which carry salt, cask, and victuals, to truck with the busses for their herrings, and carry them directly into the Sound, without returning into Holland; for it is a matter of great consequence and gain, to bring the first herrings into the Sound; for there they are esteemed as partridges with us, at their first coming: but now of late years the Hollanders are prohibited by the state, carrying or trucking away their herrings, till they first land them in Holland; which will prove the more commodious to us."

Sir William proceeds next, to state the expence of a buss of seventy tons from the stocks, with the price

of her nets, tackling, falt, victuals, casks, mens wages. and other particulars; likewife, of a pink of forty tons, for the white fishery. He also draws a comparison between the West India trade and the British fisheries, wherein he uses various arguments to prove, that the latter branch is, upon the whole, more important than the former, and merits the first attention of the British government. "You will wonder, fays he, being born a subject of England, and casting your eyes upon the gainful foil of the land, that you never conceived what the sea afforded: I confess it were impossible for you to live in that ignorance, if it did not appear by the ensuing discourse, how you, your country, and especially the princes of these realms, have been abused, and the profit thereof concealed.

What better light can we have for this work, than from our nearest and intimatest friends the Hollanders? who, by their long travels, their excessive pains, their ingenious inventions, their incomparable industry, and provident care, have exceeded all other nations in their adventures and commerce, and made all the world familiar with them in traffic; whereby we may justly attribute to them, what the Chinese assumed to themselves, that only they have two eyes, the Europeans but one, and all the rest of the world none. How can this better appear than out of their

labours and our fish only?

They have encreased the number of vessels: they have supplied the world with food, which otherwife would have found a scarcity; they have advanced trade fo abundantly, that the wealth of subjects and the customs of princes have found the benefit of it: and lastly, they have thus provided for themselves, and all people of all forts, though they be impotent and lame, that want employment, or that are forced to feek work for their maintenance.

"And because their quantity of fish is not to be vended in their own provinces, but to be dispersed in

( 53 )

all parts of Europe, I will give you an account of it, as it has been carefully observed and taken out of

the customhouse books beyond the seas.

"In four provinces within the Sound, viz. Koningsberg, Melvin, Stetin, and Dantzick, there is vended in a year betwixt 30 and 40,000 last of herrings; which will amount to more than 620,000 pounds; and we none.

" Denmark, Norway, Sweden, Leisland, Rie, Regel, Narpe, and other towns within the Sound, take off above 10,000 lasts, worth 160,000 pounds.

"The Hollanders send into Russia above 1500 lasts of herrings, fold at 27,000 pounds; and we not above thirty or forty lasts.

" Stode, Hamburgh, Bremen, Embden, and upon the river Elbe, in fish and herrings, above 6000 lasts,

fold at 100,000 pounds; and we none.

"Cleveland, Juliers, up the river Rhine, Frankfort, Cologne, and over all Germany, in fish and herrings near 22,000 lasts, amounting to 440,000 pounds; and we none.

"Gelderland, Artois, Hainhaut, Brabant, Flanders, and the Archduke's countries, 8 or 9000 lasts, fold at eighteen pounds the last, amounts to 160,000

pounds; and we none.

"At Roan in Normandy, 500 lasts of herrings, fold at 10,000 pounds; and we not 100 lasts; there commonly fold for twenty, and fometimes thirty pounds a last.

" Besides what they spend in Holland, and sell there to other nations, the value of many hundred

thousand pounds.

"Now having perfected the valuation of the Hollanders fish, caught in our feas, and vended into foreign countries, our shame will manifestly appear, that of so many thousand lasts of fish, and so many hundred thousand pounds in money made by them; we cannot give account of 150 lasts taken and vended by us.

The Hollanders are no less to be commended, in the benefit they make of the return of their fish; for what commodity soever any country yields in lieu thereof, they transport in their own vessels into Holland, where they have a continual staple of all commodities brought out of the south, from thence sent into the north and the east countries: the like they do from out of the north into the south, their ships continually going and bringing inestimable profit; like a weaver's shuttle, he casts from one hand to another, ever in action, till his gain appear in the cloth he makes.

"But the greatest navigation of theirs, and of most importance to their state, for maintenance of ships of burthen and strength, is into the Streights, from the port of Marseilles, along the coast as far as Venice. During these eighteen years last past they have so increased their navigation, whereas before they had not above two ships to five of ours within the Streights, within the said eighteen years they are able to shew ten of theirs to one of ours, and merely by the trade of sish; for true it is, that there is no commodity in the world of so great bulk and small value, or that can set so many ships of burthen to work.

"The principal work I am at, is how to undertake the Hollanders with our own weapons, and how to equal them with pinks, buffes, and other veffels, till we be made partners with them in their fishing; not by hostility, or uncivil usage, nor to deprive them by his majesty's prerogative, which the law of nations allows us; or out of envy to their labours; or to revenge discourtesies: only we will seek to do what nature distates, viz. to enjoy, and make use of our own, by the countenance of our blessed king, that in justice gives all people their right and due.

"I present you not with toys to please children, or with shadows of untruths; for I know truth to be so noble of itself, that it makes him honourable that prenounces it; and that an honest man will rather

( 55 )

bear witness against friendship than truth. I have made it appear with what facility the Hollanders go through with the golden mine of theirs, which they so term in their proclamation extant: I make proof that their busses and pinks are built to take fish; that they fill themselves thrice a summer with fish; that this fish is vended and esteemed as a precious food in all the parts of Europe; and that the return thereof gives them means to live and breath; without which they could not.

"It is manifest that fish has brought them to a great strength both by land and sea, and same withal, in maintaining their intestine war against so great and

potent an enemy as the king of Spain.

"And if all these benefits appear in them, and nothing but shame and scorn in us, let us enter into the cause thereof, and seek to amend it; let us labour to follow their example, which is better than a school-master to teach us. Nothing is our bane but idleness, which ingenders ignorance, and ignorance error; all which we may be taxed with; for to a slothful man nothing is so easy, but it will prove difficult, if it be not done willingly.

"There are but two things required in this work; that is to fay, a will to undertake it, and money to go through with it, which being found, we will place charity to begin at home with ourselves, before we yield it to our neighbours; and then this business will appear to be effected with more benefit, more strength, more renown, more happiness, and less expence, than Hollanders have or can go through withal. Time is the most precious experience; and you shall find that time will cure our carelessness past, that reason could not hitherto do.

"The instruments by which the Hollanders work, are their vessels of several kinds, as I have declared, not produced out of their own country; for it yields nothing to surther it, but their own pains and labour.

L 4

Their

Their wood, timber, and planks to build ships, they setch out of divers other places; and yet are these no more available to undertake their sishing and navigation, than weapons are without hands to sight. Their iron, hemp, cordage, barrel boards, bread, and malt, they are beholding for to several countries; and if at any time out of displeasure they be prohibited the transportation, they are to seek a new occupation, for the state sails.

"Comparing their casualties and inconveniencies with ours, you shall discern the advantage and benefit God has given us, in respect of them; for all the materials formerly repeated, that go to their shipping, England yields most of them, or in little time the earth will be made to produce them in abundance; so that we shall not need to stand upon the courtesy of our neighbours, or to venture the hazard of the sea

in fetching them.

Whereas all manner of people, of what degree foever in Holland, have commonly a share, according to their abilities, in this sishing; and that the only exception amongst ourselves, is the want of money to undertake it, you shall understand how God and Nature have provided for us; for I will apparently answer the objection of money, and cast it upon the sluggishness and ill disposition of our people, who if they will take away the cause of this imputation, they shall take away the offence due to it, and by which we are scandilized.

"In the objection of lack of money to fet on foot this work, it would feem ridiculous to strangers that behold the wealth and glory of this kingdom, with the sumptuous buildings, the costly inside of houses, the mass of plate to deck them, the daily hospitality and number of servants to honour their masters, and their charitable alms distributed out of their superfluities. And to descend to people in particular, if they behold the bravery of apparel vainly spent, the rich and curious jewels to adorn their bodies, and

the needless expences yearly wasted, they would conclude, that it was not want, but will, that must be our impediment."

After enumerating the various natural productions raised in England savourable to the sisheries, Sir William enforces his favourite theme, by sundry nautical remarks, all of them proving, beyond a doubt, the superior advantages which the natives enjoy from their local situation; and the vast riches, which are yet in store, from this inexhaustible source, to all British subjects, who shall search after them.

He describes the various qualities of salt most proper for the sisheries, made on the coast of Europe and Africa. "And, says he, for such salt as shall be used in the Lewis (one of the Hebride islands) there is no place lies more convenient, for the making of salt of any kind, than in that island, the sea having an extraordinary saltness, and the country af-

fording so great plenty of fuel \*.

"The English and Scottish fishermen that shall use that fishing, shall find as great, and as extraordinary profit and gain, by receiving their salt at the island when they shall there arrive, as the freight of their ships will come to; for whereas they use now to bring in their ship the best part of their lading in salt, finding their salt made ready to their hands, instead of salt, they shall lade themselves with casks, and other things wanting for their use."

Nature having thus bestowed the herring sishery on the Scottish shores, as an equivalent for her scanty dispensations in soil and climate, it is but fair, that the inhabitants should be permitted the full enjoyment thereof; or, at least, some exclusive privileges, by which they may not only arrive much earlier at

<sup>\*</sup> This is not the case at present, unless he means turs. To the scarcity of timber in those islands, is added an impolitic duty on coals carried thither from the Clyde, a grievance which requires immediate redress.

foreign markets than the Dutch, but also be enabled

10 fell their cargoes somewhat cheaper.

Many have been the conjectures why foreigners are indulged with the monopoly of this fishery, but no person hath yet been able to advance an argument in favour of it. To suffer our own people to starve, emigrate, and desolate the country, through want of employment, by thus permitting strangers to seize the provisions, and means of commerce, which nature designed for the natives only, is one of those paradoxes in politics, so peculiar to the present age, and which will remain inexplicable till the end of time.

All the shoals (fays an anonymous author) appointed by the immutable decree, to possess the firths and bays on the east shore of Britain come into the German sea by the east side of Shetland, and that not many leagues from the shore; as those appointed to spawn in our north and west bays of Scotland, which are much the greater numbers, swim by the west side of it.

But these natives of our Scots bays in the German sea swim close by the shore, which is the reason they cannot escape, and are so broken, that they never come in confirmed shoals, or great bodies, to their spawning beds, any year the Dutch can constantly keep at sea the months of June and July. For how is it possible to escape 5 or 600 miles of nets that every night strains every foot length of water sive or six leagues from the shore?

"Every Dutch buss has a large mile length of very deep nets dragging after him every night from fun-set to sun-rising. There are about 6 or 700 of them come now generally out; the constant station of all these is the east coast of Shetland; they never go further than four or five leagues from the shore, yea I have seen them fish within half a league. The nearer the shore, so that there is water deep enough to keep their nets from the bottom, they sish the better: for the herrings that make their course to the

( 59 )

cast coast swim close by the shore: for no compass more justly directs the ship to her port, than the leaders of that innumerable army of herring guides their body to the particular bay or firth natural to

them, and they directly make for.

"They many years make two or three loaded returns; and this last summer (1728) though our few busses came home almost empty, I am credibly informed, the Dutch, after ours came away, carried two or three freights home, though it is certain the strue right herring on the coasts of Shetland; but the latter end of the year, by their good patience, they staid out the bad weather, and though they did not sish the good fat herring they commonly used, in the proper station for such herring, they followed the herring, picked up their loadings of spent big-belly'd ones on the coasts of Caithness, Buchan, Bamss, and all the Murray Firth. Any was better than going home empty handed.

"It was happy for our shallow waters, or firth-fishing, the summer was so bad, that the Dutch could not fish on the east coast of Shetland, to take, break, or divert the shoals, that by the command, and unalterable decree of the first omnipotent fiat, are appointed constantly to keep that very rout, to come to our shores and propagate their kinds. For, since the French in Queen Anne's reign, burnt 5 or 600 Dutch busses in one day, we had not so many herrings in our firths and bays on the east coast of Scot-

land, as we had this year."

Besides the detriment to the British sishery as above related, and frequently mal-treating the natives, the Dutch, by means of their universal correspondence, are enabled to forestal the European markets even before the herrings are taken, a circumstance which will, unavoidably, retard the progress of the native sishery, notwithstanding every effort of government in support of it. Of this we have an instance in the year 1771, when the herrings exported from Glas-

gow,

gow, and the ports of Clyde, to Ireland, America, the West Indies, and elsewhere, amounted to 14,818 barrels only. Those exported from the north, and eastern shores of Scotland were still less considerable. But so soon as foreigners are prohibited this sishery, or subjected to certain regulations, so soon will our own people export, possibly, to the amount of 3 or 400,000 barrels of red and pickled herrings annually; the good effects of which, will even reach the capital, and every manufacturing town in England, by the demands for goods, to supply the wants of an active people thus enriched.

Of late years the Dutch herring fishery hath been on the decline, in these seas. This is partly owing to the great increase of commerce and wealth, amongst that people, and partly to the want of markets, arising from the rivalship of the Swedes, Norwegians, Danes, Hamburghers, &c. who now frequent the Scottish seas, and are equally expert in curing, as the Dutch. The fishery, though the hands be changed, remains invariably the same, to all those who choose to resort thither. It is an inexhaustible mine of wealth, sufficient to enrich a considerable part of the Scottish nation, besides the giving employment, as in Holland, to people of thirty different professions.

The fisheries are the natural, and most permanent exports of Scotland to foreign parts. It was by means of the fisheries that the princes of that kingdom were enabled to erect, in the 11th, 12th, and 13th centuries, those numerous and magnificent ecclesiastical edifices, whose ruins, even at this time, are beheld with admiration. It was the fisheries which procured that gallant nation the weapons and means of self-defence, against all invaders, however formidable; and which enabled them not only to defend their liberties, but to drive their enemies with great loss and disgrace, from a country which, with indefatigable perseverance, they labour to subjugate. It was the fisheries which lined the eastern coasts with populous thriving towns, filled their ware-houses with the va-

rious produce of Europe, their cellars with the choicest wines; and which, combined with services performed by Scotsmen in the armies of contending princes, gained that nation many distinguished privileges abroad, which it enjoyed uninterrupted, while it remained a separate kingdom.

To the decay of public spirit, after the death of James V. was owing the decay of the sisheries, and the decline of national importance. In proportion as Scotland lost sight of its true interest, and neglected to profecute the sisheries with its former vigour, in the same proportion did the Dutch by those means

rife to power, wealth, and fame.

If, therefore, the Scots wish to recover their hereditary patrimony, the stable source of commerce, navigation, and national consequence, they will embrace this feason of commercial regulation, to secure the fisheries to their rightful owners, either by a total prohibition of all foreigners from fishing within a limited distance of the Scottish shores; or, by subjecting them to fuch tonnage, or duties, as will prevent them from engroffing foreign markets. This the Scots have a right to expect; it is the law of nations, the language of common sense; even the Dutch themselves could not deem it unreasonable. On the contrary, they have fet the example, in their infignificant fishery upon their own shores, which they farm, or let out to the best bidder; thereby making a property of the sea; and, if report be true, they exclude all foreigners from sharing therein, by purchase or otherwise. The proposition, now suggested, would answer another valuable end in favour of Scorland. The annual revenue, thus paid by foreigners, might be vested in the board of trustees at Edinburgh, to be by them appropriated, unalienably, within that kingdom, and upon such objects of national utility, as might feem most conducive to the general welfare. rije po province roma i province

### Of the Eastern Fisheries.

ITHE herring fisheries on the east side of Scotland were, antiently, very considerable; infomuch, that 3 or 400 vessels resorted annually, from various parts of Europe, to a fair held at St. Andrews, then a town of two miles in circumference, and which possessed above seventy vessels, and a slourishing commerce. That place was plundered, and completely ruined by Cromwell's army, and hath not, to the present time, been able to recover itself. The same sate besel Dundee, and all the populous trading towns on the Forth, which were, formerly, the glory of North Britain.

A small herring fishery is, however, carried on by boats along that side of the island, from Wick in Caithness to the river Forth, but subject to sundry duties and sees, which it would be expedient to abolish.

Nothing can contribute more to the full restoration of these eastern sisheries, than navigable communications to the west side of the island; where, should the East Country markets prove at any time unfavourable, the people would always find a demand at Glasgow, or Greenock, for that of the West Indies. These navigations would also facilitate the correspondence between the East Country and Spain, Portugal, the Mediterranean, the Canaries, and other Western Islands, where herrings are highly esteemed. By thus enjoying every possible chance of markets, the sisheries would gradually increase, and those eastern shores recover their former splendour.

Having, in this manner, connected the various herring fisheries under one general head, stating their importance to mankind, and the means by which they may be rendered more subservient to the commercial interest of the British kingdoms; it is hoped that the following outlines of a plan, for the improvement of the Western Fisheries, will not be deemed

deemed unworthy of notice; especially, as the utility of the proposal, is strongly enforced by the very distressed situation of the inhabitants.

The expediency of erecting Villages and Harbours in the West Highlands—The plan of those Villages—The most proper situations—Estimates of the Expence.

THE necessity of bringing the Highlanders nearer to the Low Countries, by means of inland navigation, hath already been mentioned. The facility and ease by which that bufiness may be completed. hath also been explained: and no argument, of any weight, can be advanced against its being carried immediately into execution. A requisition founded on humanity, justice, and national expediency, cannot have many opponents. Happy would it be, was this the only expence necessary to extend the fisheries, and to establish in those parts, a populous colony of useful subjects. In a country where soil and climate have been fo niggardly of their favours, some further indulgence is requifite. The people should be comfortably lodged, and accommodated with provifions, utenfils, flores, and firing. This implies the erection of villages at convenient distances, and in the most eligible situations on those extensive shores.

After having selected the particular lakes destined to become the scenes of population and business, it would be necessary to examine into the depth of water, the rivulets, timber, metals, soil, and other particulars; and to have drawings of each respective lake, for the inspection of government, and the public.

The business thus far advanced, an act of parliament would be requisite to enable the board of trustees at Edinburgh, to purchase sundry lands, whereon to erect the buildings, and to accommodate the same with small gardens and fields. Every village would also require a territorial revenue, from 2 to 300 pounds, for the support of a clergyman, free-school,

school, repairs, and other purposes, at the discretion

of the trustees in time being.

The expence of lands, thus purchased, for the various purposes of building, accommodating, and endowing every respective village, may be estimated at 10,000 pounds.

The buildings requisite at the first establishment of

the proposed villages are,

1. A key or breast, for small craft.

2. A range of warehouses, for casks, staves, hoops, falt, nets, fish, oil, grain, meal, skins, wool, flax, bark,

timber, coals and other bulky articles.

- 3. Sheds, for persons employed in gutting, salting, and curing the herrings; with losts where the people may be sheltered at night, from the inclemency of the weather. Every village should also be surnished with materials for erecting temporary sheds or tents for the conveniency of occasional distant sisheries.
  - 4. A small market place.

5. A corn mill.

6. A church, and house for the minister.

7. A school house, where reading, writing, the common rules of arithmetic, and practical navigation, may be taught gratis.

8. A public inn.

There might, possibly, be some difficulty in procuring useful mechanics to settle in these remote parts, previous to the regular establishment of sisheries, and commercial intercourse. Therefore, to encourage adventurers, as coopers, carpenters, net makers, blacksmiths, &c. it would be necessary to build sisteen or twenty dwelling houses, where these persons might live rent free; each house to be accommodated with three small inclosures. 1. For a garden and offices. 2. For potatoes. 3. For the support of a cow.

Such luxuries as these, with variety of fish at no expence, would draw thither useful workmen from every

(65)

every quarter, and give stability to all the valuable

purposes proposed by the public.

A fum scarcely equal to the average expence of Gibraltar for one year only, and which would soon be repaid by an increase of trade and revenue. But, should any of the towns fail of success, so as not to answer the valuable ends proposed by government, the lands, and other property, could at any time be sold, and the money refunded to the Exchequer, or applied to some other public uses.

## The most eligible situations for Towns.

THE fituations most proper for the erection of towns, magazines, or marts, seem to be at the undermentioned places on the mainland.

Lochfyne, in Argyleshire. This situation hath the advantage of a soil partly level, and tolerably sertile. The surrounding districts abound in black cattle, woods, slate, white marble, and limestone. The cattle are driven to the Low Countries for sale; the woods are used in forges, and burnt for charcoal to supply the iron works in Lancashire. Esdale and

other small islands on the coast, are composed entirely of slate, of which near three millions are transported annually to various parts of Britain, Europe, and America. This place having the ocean on the west side, and Lochsyne on the east, enjoys every possible advantage for the sisheries. Situated amidst the shoals of herrings which occasionally visit Lochsyne and the Firth of Clyde, the inhabitants would be ready on the first approach of these sish, and in all kinds of weather, to sink their nets; thereby gaining, almost at their doors, the means of commerce and wealth. Or, should the herrings appear on the west side of the Peninsula, the people, by means of the canal, would soon arrive at the fortunate lake or bay.

Their local fituation, and superior opulence, would also enable them to embark in the white sishery with stouter boats, and better manned and provided, than any which the indigent people on these western shores can at present afford. This place would likewise become the great refort and thoroughfare of mankind, a centrical mart, to which the Highlanders from all parts of the mainland, and the islands, would bring their fish, oil, feathers, skins, wool, timber, bark, slate, kelp, and other useful articles of commerce, as to a ready market; or, should that fail, they would find themselves within two tides of Greenock upon the Clyde, of itself a considerable mercantile town, but still more important, from its being the chief port of Glafgow, a city well known in the commercial world. On the other hand, the people of the Low Countries would refort to this Highland mart, to fell or barter their various manufactures; and even the English riders, who in all feafons, and in all kinds of weather, pay their respects to every town in Scotland, would find the way to the banks of Lochfyne, with their famples from London, Birmingham, Manchefter, Sheffield, Leeds, and other industrious towns of that populous kingdom. Upon the whole, the

istand of Great Britain does not present a situation more conducive to general utility, than the proposed opening, or pass, to this terra incognita of our island, abounding in woods, mines, and inexhaustible fisheries. It would be the key to the West Highlands, and to those numerous, helpless islands which have hitherto been excluded the fociety of mankind; whose hospitable and virtuous natives, have been left to the mercy of boisterous elements, and unpropitious seafons, to languish, and to perish through famine and neglect. This therefore becomes the first object of attention in the improvement of these western shores; the key stone to the whole arrangement; worthy the immediate attention of the legislature, and calling strongly, upon the feelings of every liberal, humane mind.

Lochfyne, besides the narrow channels at its entrance, is the largest of all the Scottish lakes, being forty miles in length, from one to sour in breadth, and from sifty to seventy fathoms in depth. The herrings sometimes croud in shoals to the very head of it; pursued by the larger sishes, and attended by gulls and other voracious sea sowls, which skim incessantly upon the surface of the waters.

On the west side of this lake is Inverary, the summer residence of the antient and illustrious house of Argyle, descended from a line of kings; a family of distinguished warriors, patriots, and statesmen; the hereditary patrons of arts, science and improvements; to whom their country is chiefly obligated for that excellent institution, The Board of Trustees, and the present flourishing state of that important staple, the linen manufacture.

The environs of this magnificent seat, abound in thriving plantations; some of the trees are of a great age, and in sine perfection. The inhabitants of the town are well lodged in houses of stone, lime, and state. They are fully employed in arts and manu-

factures; plentifully supplied in the necessaries of life; and in every respect happy under the benevolent hand of the present proprietor. A noble example to the gentlemen of the Highlands, whose efforts, if affisted by government, may, even in the present

age, reclaim their hitherto useless country.

2. Keeping due north, upon the western shore, we come to OBAN BAY, defended from west winds by the island of Kerrera, and from other winds, by the high lands on the continent. This bay is in depth from eleven to twenty-fix fathom water. Besides, the whole found of Kerrera is in effect a harbour, or at least a commodious road, with twenty fathom water, and good anchorage almost throughout. There are two havens in the island, one having an outlet to the north east, the other to the north west; insomuch that vessels may enter and depart without inconveniency, and with any wind. Oban is also in the tract of the fifthing buffes and coasters passing to and from the North Highlands; and, being fituated at the entrance of the great Loch Linnhe, it may be confidered as the western port of the proposed navigation between the Atlantic and Inverness. A beginning hath already been made towards forwarding a town at Oban, which, besides its being almost surrounded with lakes, bays, and fisheries, stands in the most fruitful part of Argyleshire, called Mid-Lorn. In its neighbourhood there is an iron furnace, the property of Englishmen, from Lancashire, who bring the ore to this place on account of the natural woods in its

3. Loch Sunart. A fine lake penetrating twenty miles into the country of Morvern in Argyleshire; it is shaded with woods, enriched with small islands, and hath a profitable lead mine at Strontian. The diffrict around Loch Sunart contains 2500 inhabitants; the ise of Mull, to which it is contiguous, hath 4000. This lake opens into the north entrance of the Sound

of Mull, facing Tobirmoire Bay, an extensive circular bason, secure from all winds, and of sufficient

(69)

depth for ships of the line.

4. Bernera. Here terminates the military road from Edinburgh and Glasgow, on the fouth, and from Inverness and Fort Augustus, on the east. It is the usual pass between the continent and the lile of Sky, and was on that account judged a proper station for a garrison, which, in 1722, was accommodated with barracks sufficient to lodge 200 men. Bernera hath Loch Duich on the north, Loch Urn \* on the fouth, and the great island of Sky, containing from 12 to 15000 people, in front; from which it is separated by a narrow but navigable channel. Being thus a great thoroughfare by land and water, abounding in people, cattle, fish, and timber, it hath a strong claim to public affiftance in the forming of a town.

Here Dr. Johnson experienced the hard fate of all travellers who are under the necessity of putting up

\* Mr. Pennant thus describes Loch Urn, which curiofity led him to explore in a boat.—" Beyond that was another reach. and an instaneous and agreeable view of a great fleet of buffes (August 6) and all the busy apparatus of the herring fishery; an unexpected fight at the distance of thirteen miles from the sea. A little further the Loch has a very narrow inlet to a third reach: this strait is so shallow as to be fordable at the ebb of spring tides; yet has within, the depth of ten and seventeen fathom: the length is about a mile; the breadth a quarter. About seven years ago it was so filled with herrings, that had crouded in, that the boats could not force their way, and thousands lay dead on the ebb.

"The scenery that surrounds the whole of this lake, has an alpine wildness and magnificence, the hills of an enormous height. and for the most part cloathed with extensive forests of oak and birch, often to the very fummits. In many places are extensive tracts of open space, verdant, and only varied with a few trees scattered over them: amidst the thickest-woods aspire vast grey rocks, a noble contrast! nor are the lofty headlands a less embellishment; for through the trees that wave on their summit, is an awful fight of sky, and spiring summits of vast mountains.

"On the fouth fide, or the country of Knodyart, are vast numbers of pines, scattered among the other trees, and multitudes of

young ones fpringing up."

at the inns of these neglected regions. Having travelled from Fort Augustus through an almost uninhabited tract of near fifty miles, he was told at Glenelg, that on the fea fide, he would come to a house of lime and flate and glass. This image of magnificence raised his expectations. At last he arrived at the inn, weary and peevish, and began to enquire for provisions and beds. Of the provisions the negative bill of fair was very copious. Here was no meat, no milk, no bread, no eggs, no wine. He did not express much satisfaction. Here, however, he was to stay. A new disappointment awaited him. He goes to examine his lodging. Out of one of the beds, on which he was to repose himself, started up, at his entrance, a man black as a cyclops from the forge. Sleep, however, was necessary. A faithful guide from Inverness, at last found some hay, which the inn could not supply. He directed the Highlander to bring a bundle of it into the room, and flept upon it in his riding coat. Mr. Boswell being more delicate, laid himself sheets with hay over and under him, and lay in linen like a gentleman.

The lakes on this coast are so numerous, extensive, and important, that it is difficult to pass over any one of them without saying, Here is a proper station for a town, a harbour, a market, and a church. We must however, agreeable to our limited plan, omit the description of three fourths of these extensive waters, though, all of them, the occasional resort of those kind visitors which compose the riches of the Caledonian shores.

5. Gare Loch. Paffing by Loch Duich, Carran, Kisserne, and Torridon, we come to Gare Loch a capacious bay extending several miles within land, inhabited by 3000 people, who are alternately engaged in the herring and white sisheries. Besides the deep indented shores of this part of the continent, here is a channel, forty miles in width, bounded on

the west by the Lewis or Long Island \*, whose shores, as well as the intervening sea, are one continued receptacle of white sish, herrings, seals, &c. but those sources of wealth are almost lost to the poor natives, from their remote situation, and the equally hazardous navigation by the Pentland Firth, and the Mull of Cantire. To this district therefore, the proposed passage, into Loch Fyne, and the Clyde, will be attended with the most solid advantages .

6. Loch Ewe. This capacious bay penetrates eight miles into the country, where it receives, through a narrow passage, the waters of Loch Maree, a beautiful fresh water lake, sisteen miles in length, of great depth, abounding in salmon, char, and trout. Of the last mentioned, is a species which weighs from twenty-sive to thirty pounds. The banks and headlands of this lake are, as usual, fringed with woods. The narrow strait which unites the waters of Loch Ewe and Maree is the centrical station between Inverness on the east, and Lewis on the west, communi-

\* A range of islands connected, or nearly so, at low water; and extending from north to south 120 miles in length. The southern parts are the most fruitful of all the Hebrides: the whole might, by proper management, give employment to 10,000 able seamen.

† "Herrings, fays Mr. Pennant, offer themselves in shoals from June to January; cod fish abound on the great Sand Bank, one corner of which reaches to this bay, and is supposed to extend as far as Cape Wrath; and fouth, as low as Rona, off Sky, with various branches, all fwarming with cod and ling. The fishery is carried on with long lines, begins in February, and ends in April. The annual capture is uncertain, from 5 to 27,000. The natives at present labour under some oppressions, which might be easily removed, to the great advancement of this commerce. The want of a town is very fenfibly felt in all those parts: there is no one commodity, no one article of life, or implement of fishery, but what is gotten with difficulty, and at a great price, brought from a distance by those who are to make advantage of the necessities of the people. A town would create a market, a market would foon occafion a concourse of shipping, who would then arrive with a certainty of a cargo ready taken for them; and the mutual wants, of franger and native would be supplied at an easy rate."

cat

cating with the former, by a military road, with the latter, by a government packet. It is the last thoroughfare between the two feas, in Great Britain; on which account, as well as its fituation for the fresh, and falt water fisheries, it hath a claim to public attention.

7. Loch Broom. The entrance to this celebrated lake forms a capacious bay, twelve miles in length, and from five to ten in width. Loch Broom extends nine miles farther into the country, is generally one mile in width, and of great depth. This lake on the west, and the Firth of Cromarty on the east, approach so near each other, that the distance between the two feas does not exceed thirty miles. The produce of the country around Loch Broom are cattle, which are generally purchased by graziers from Yorkshire, also timber, mountains of marble and limestone. The rivers and fresh water lakes communicating with Loch Broom abound in falmon, trout, and char. The shores are populous, but the people are discontented, and strongly disposed to emigrate \*. On these accounts Loch Broom appears to be a proper station for a town or village, and still more so when we consider it in a commercial light.

This lake is not only the greatest resort of herrings in Britain, but the fish have the reputation of being the richest, largest, and most delicious of any

\* " The parish of Loch Broom, says Mr. Pennant, is one of the largest on the Mainland of Scotland, being thirty-six miles long, and twenty broad. It has in it seven places of worship, but is destitute of a parochial school. None of the people except the gentry understand English. Dispirited and driven to despair by bad management, crowds were now passing, emaciated with hunger, to the eastern coast, on the report of a ship being there loaded with meal. Numbers of the miserables of this country were now (1774) migrating: they wandered in a state of desperation; too poor to pay, they madly fell themselves, for their passage, preferring a temporary bondage in a strange land, to starving for life in their native foil." that ( 73 )

that have been taken in the European feas \*. It hath therefore been the chief scene of the Western fishery for many ages, and is, at present, the most usual rendezvous of the busses from the Clyde, though much discouraged by the dangers of a long navigation, which, as hath already been observed, might be

hortened at a trifling expence.

8. From Loch Broom to Cape Wrath, the lakes diminish in fize, though not in number, and the coast is less populous. It is a country little known, and almost cut off from any intercourse with mankind. Lying, however, in the tract of shipping to and from the Baltic, a harbour towards Cape Wrath, would prove a most desirable shelter amidst the hazardous navigation, and frequent hurricanes on that northern fhore.

Having thus appropriated the most considerable part of the supposed fund, in forming a line of small, but useful harbours, for the conveniency of these distressed inhabitants, the improvement of the sisheries, and the benefit of navigation; it is proposed to apply

\* " At Yarmouth, fays Sir William Monfon, we may account the goodness of the herrings spent; for betwixt Winterton and Orfordness they use to spawn, and are called by the Hollanders the ropefick herrings, which they forbear to take.

" From Orfordness the herrings direct their course to the North Foreland in Kent, where they furnish both the English and French shores with so many as are taken by both nations, though they be

both shotten, and of the worst kind.

An easterly wind carries them the length of our channel, till they arrive at the Land's End in Cornwall, from thence they divide themselves like a fleet of ships that should be directed by a general: fome go through St. George's Channel, betwixt England and Ireland; others to the westward of Ireland, till they arrive at the Islands of Hebrides the place of rendezvous; and we may suppose they are at home, by the strength and goodness they find in that place; for though they run the length of our channel lean and fick, yet as foon as they repair to those islands, they become the largest, the fairest, and the best herrings in the world; and here they are taken in loughs and harbours, as I have faid, and valued at forty shillings the last above others."

the remaining moity, on the north and eastern shores; with a view to the same valuable purposes.

After passing round Cape Wrath, we enter upon an extensive coast facing the northern ocean, which hath always been considered by mariners as the most dangerous, and difficult navigation in these kingdoms, if not in Europe. To the dark fogs, and frequent hurricanes of the north feas, are added the whirlpools, counter tides, and violent currents of the Pentland Firth, occasioned by the vast weight of the ocean falling upon the narrow channel which separates the continent from the Orkney Islands. The rapidity of these currents, at certain periods of the tide, often baffle all the efforts of the most skilful seamen, to prevent vessels from being driven against the rocks or shores on either side of this tremendous passage. The navigation is equally hazardous in calm, as in stormy weather; because, in a dead calm, the ship, not being under the government of the helm, is hurried on, with irrefistible velocity, to whatever direction the current leads, whether towards the impending rock, the fandy beach, or the open sea. On the other hand, should a vessel be driven into the Firth by the violence of a tempest, in the dark winter's night, her fituation is dreadful beyond description. Such is the force of the winds and waves, that stones of vast fize are torn from the cliffs, and heaved over the high rocks, into the adjoining fields \*.

Notwithstanding

\* The caverns formed by the violence of the ocean upon these shores, excite the admiration of every curious traveller. Some of them reach so far under ground that no person dares venture to the extremity. They are the resort of seals and sea dogs, which the natives, at the risk of their lives, turn to good account. These bold men enter the caverns in boats, and having lighted their torches, make a loud noise, which brings down the animals in a confused body, with frightful shrieks and cries. They pass out of the cave in such numbers, that the men are obliged to give way until the torrent hath spent itself, when they fall upon the stragglers, whom they knock on the head with clubs. The value of the seal consists

( 75 )

Notwithstanding these obstructions to the navigation from Ireland, Bristol, Liverpool, and the whole western coast of Great Britain, to the Baltic, nothing hath been done to affift that navigation, and to leffen the frequent disasters which every succeeding winter brings upon those who are engaged in it. Here are no towns, harbours, lighthouses, dock yards, or carpenters for the repairing of damages. The unfortunate vessel, though reduced to the greatest distress, must proceed to the Baltic, or the Irish channel, before the can receive the smallest repair. A coast of near 400 miles from Ireland to the Orkneys, could not, in the greatest emergency, furnish a sail, a cable, or an anchor. These considerations serve to enforce the expediency of two harbours on this northern front of our island; one near Cape Wrath, and the other within Dungsby Head. Nor is the relief of the natives, and the improvement of the country, a matter of less importance. Here is a coast extending above seventy miles in length, abounding in white fish, feals, oysters, and other shell fish. Its rivers are more copious than those on the east and west sides of that district; they issue from lakes which are said to swarm with falmon, besides the incredible numbers which come in with the tides, of which, report fays, 3500 have been taken at Thurso in one morning. The country lying upon the coast is more fruitful than might be expected from its northern fituation; it is highly improveable, and abounds in limestone, marle and iron stone. The numerous remains of Pictish houses, Scottish castles, and other buildings upon the north and east side of this district, seem to indicate a greater degree of population in former times. Its importance is further confirmed by the Danish historian Torfæus, in his account of the attempts made by his

confists in its oil, which is of a superior quality, and brings a high price, but the people of these shores are too poor to carry on a regular sishery.

countrymen to obtain a fettlement in these parts, and the able desence maintained by the natives, through a series of ages, till at last the Danes, tired out with fruitless expeditions, bade a final adieu to that coun-

Of the many commodious bays along this coast, that of Loch Eribole claims the preference, being one of the finest roads for shipping in Europe, and so capacious that ships of the line may enter it at low water, and find good anchorage. Its situation near Cape Wrath, renders it still more worthy of consideration, as it would be a safe retreat to vessels upon their passage round that promontory.

Proceeding eastward we come to Thurso, a place of great antiquity, and at present the first, and only town, between the Irish Channel and the Pentland Firth. Its utility on this narrow strait, need not be mentioned; happily for mariners, it hath a commodious bay of forty feet water, where ships may ride out any storm in perfect safety, but it is without a good harbour, and all those conveniencies so necessary to the wants of shipping in this hazardous strait.

Passing round Dungsby Head, we enter the British Sea\*, which presents a line of coast extending near eighty miles in length, without a harbour, and scarcely a town that merits notice. It hath all the advantages of the fisheries, which have so often been described, though in a less degree than those on the western coast. It is commodiously situated for com-

\* Stiled in foreign maps, the German Ocean, but with great impropriety, as it barely touches that empire; whereas it washes the whole eastern shore of Great Britain from the Pentland Firth to the Straits of Dover. Neither hath it any claim to the appellation of ocean, which implies a great body of water without any entire separation of its parts by land, as the Atlantic, and the Pacific Ocean. A sea being a smaller collection of water, confined between lands, but communicating with the ocean, justifies the deviation which I have made from the usual custom, respecting the name of what ought properly to be called, The British Sea.

merce,

merce, and the people are remarkably industrious. The only place that hath the appearance of a port, is Wick, a finall but antient borough-town, fituated at the mouth of the river Wick, which forms a tide harbour for a few vessels of small burden, and might be improved. But, at the distance of three miles north, is Sinclair Bay, a capacious road, with good anchorage for shipping of any size. As this bay lies directly on the east entrance of the Pentland Firth, as Thurso does on that of the west, the expediency of a harbour on the former, must appear obvious to any person who chooses to consider the subject, and who wishes to affift the diffrest mariner, and promote the commerce of his country. Of still greater importance will this place appear, when it is known, that from Wick to the Firth of Cromarty, a distance of fixty miles, the shore is bold, rocky, and utterly inadmissible to sea vessels of any size, the waters of Dornoch excepted, which, however, are of no great utility to navigation, by reason of shallows and quick sands. Neither can the Firth of Cromarty, though one of the finest harbours in the world, be considered as an asylum to ships in distress, because it lies out of the track of navigation. The coast along the Murray Firth, though more commodiously situated, is, however, destitute of good harbours; consequently, a ship passing from one fide of Great Britain to the other, by the Pentland Firth, cannot be accommodated with the smallest assistance between Peterhead and Belfast Loch, a voyage of 500 miles! As the same inconvenience attends the Baltic and East Country trade in general, it is unnecessary to speak further on the subject.

We shall therefore conclude this survey, by obferving, that the money expended in improving the Highlands, will, at the same time, preserve the property of the merchants, save the lives of the mariners, promote the commerce, and facilitate the navigation, of all the three kingdoms.

While I was engaged in the preceding pages, an event of the most calamitous nature, befel the inhospitable regions which I had been describing. The year 1782 proved remarkably cold and wer, the crops over great part of Europe were more or less injured, and the northern climates experienced a scarcity, amounting to a famine. The scanty crops in the Highlands of Scotland were green in October, when a fall of fnow attended with frost, prevented every species of grain from arriving at maturity. The labour, the feed, and the straw were lost. Potatoes, which in bad feasons had proved a substitute for grain, were this year frost-bitten, and rendered entirely useless. Thus the earth withheld its bounty for the support of man and beaft. During this diffress at home, no relief could be obtained from abroad. Ireland, the granary of the Hebrides and western shores of Scotland, thut its ports against the exportation of grain; those of the Clyde were unable to give any affiftance; while, on the eastern side of the kingdom, the hazards of enemies cut off the necessary supplies from Germany, the Baltic, and, in a great measure, from

Thus deprived of every resource, by the double calamity of war and scarcity, many hundred persons languished and died through the want of sustenance. The husband and the parent, unable to behold these scenes of distress without endeavouring to relieve them, set out, amidst frost and snow, upon the long and almost impracticable journey to Inverness, where they expected to purchase a little grain with the produce of their cloths or furniture, which they had previously sold, in the districts where they resided. Several of those who had engaged in this generous enterprize,

(79)

enterprize, fell a facrifice to hunger and cold, in their way to the market. They were found dead on the roads, in caverns, and amongst thickets, where they had taken shelter from the inclemencies of the weather, while the small, emaciated horses, the companions of their distress, could scarcely stand or walk.

Such was the dreadful fituation of the mainland, and the islands, during the winter and spring; and though expresses were dispatched to the Lowlands, by the clergy and others, imploring immediate relief for a perishing people, it doth not appear that application had been made to government, for that purpose, before the beginning of the summer 1783, when a generous supply was readily granted.

Let us now suppose that a few small harbours and granaries were established at proper distances, along these western shores, and that the communications to the Lowlands were shortened by means of inland navigation; such calamities, if not in a great degree prevented, might be so far mitigated, as to save the lives of thousands, besides obviating the necessity of occasional calls upon the Treasury for the relief of those parts.

The year 1782 furnishes another argument in favour of these proposals. The annual arrival of the herrings in the West Highlands had never been known to fail, completely, till this remarkable year, when these little visitors seemed to conspire with the seasons, in order to rouse the notice of government towards these distant shores. While the elements kept back or destroyed the regular produce of the earth, the herrings abandoned their well known lakes, directed their course towards the Irish channel, or stopt there, after their usual progress round Lands End; and here the Highlanders, not being provided with proper vessels, were unable to follow them.

This was not all. While those people were deprived of grain, roots, milk, vegetables and herrings, their usual food in good seasons; an almost uninterrupted fuccession of storms, such as had not happened within the memory of man, prevented them from attempting the white fishery; neither could they, had the weather been moderate, go to sea without the means of fustenance. Here therefore was a double famine; the cup of affliction and distress, arising from every possible cause, was now full. From this ne plus ultra of human depression we entertain a hope that matters will revert into a contrary direction. under the auspices of a benevolent sovereign and parliament, to whose humane, as well as political attention, that country and people are most humbly recommended.

APPENDIX.

## APPENDIX

Nº I.

Corroborating Proofs respecting the calamitous State of the Highlands.

Extract from Dr. Campbell's Political Survey of Great Britain, published in 1774.

IN delivering the History of the Hebrides, and their inhabitants, we have shewn (at least as far as the few lights we have would allow) what they once were, and by what a series of missortunes the inhabitants of them were gradually reduced from being a populous, civilized, and thriving people, into that low and wretched state in which they now are. It is to establish this fact incontestably, that so much notice has been taken of the ruins and remains of ancient buildings erected in former ages, which from their solidity and extent clearly evince, independent of history and tradition, a superior number of people, by whose labour and for whose use they were raised.

By the description of some of the principal isles, it is hoped they are proved to be in themselves, and from their natural advantages, still very considerable, worthy of public attention, and capable of being thereby recovered. But this arduous task of retaining, restoring, and retrieving so many countries, seems, in the present circumstances of the empire of Great Britain, to be a matter of much too great importance to be left without some further de-

In the first place, then, let it be observed, that these neglected isses are, even at this day, far from being destitute of things necessary for the subsistence of much larger numbers than are as present contained in them \*, and that they are likewise very far from wanting

\* The doctor must mean various species of sish, and the returns which may easily be procured in exchange for these, so soon as commerce shall be introduced amongst the people. With regard to grain, the main support of all European nations; these islands are in general so deficient, that even the best seasons do not supply above one third of the people. This is particularly the case with Jura, Mull, Sky, and Lewis; which islands, comprehend more than two thirds of the whole Hebrides. Ilay, Lismore, Colonsay, Tirey, Cannay,

wanting many of those materials which industry in other countries renders objects of commerce, and which might be consequently rendered so in these, by the proper application of the same plans. Encouragement will soon beget industry, industry improvements; and these will proceed with a quick pace amongst an ingenious and spirited people. It is not to be expected that all or even any great numbers of these improvements should be immediately attempted; but there is nothing more probable than that gradually these, and many others, which it surpasses the power of a private person to suggest, will take place, as opportunities offer from the proposed alterations in the state of these countries, and the circumstances of those who inhabit them.

In order to accomplish so great and so desirable a work, it will be absolutely requisite that the public, for its own sake, should afford its affiftance; and therefore it is highly expedient, before this can be expected, to state succinctly the motives which ought to perfuade the particular attention of the state to the rescuing these isles from their present low and dejected condition. It would, in the first place, add a very considerable province to the British Empire, of which though we have long had both the title and possession, yet this has been in a great degree without utility; and, as from a long deduction of facts we have clearly shewn, has for near 200 years \* been reported by the best judges a negligence equally detrimental and diffraceful to government. By this means multitudes who have been for a feries of years, and if things go on in their present state will be for ever, unprofitable to the community, might be connected with and rendered useful to society. This is a point of infinite importance; for whatever benefits accrued to individuals must at the same time turn to the emolument of the state. On views far less probable, and much more uncertain, large fums have been spent, and annual supplies given, for the settling and maintaining more distant colonies, which having in a reasonable space answered our expectations, fully justifies the policy of such measures, and thereby renders it clearly inexcusable to remain blind to the innumerable advantages which with more than equal certainty might be secure to the state, by taking proper notice of countries that lie at our own

Harris, North and South Uist, are fertile, and pleasant. If to these we add sundry small islands whose soil is equally good, and also some narrow tracts of good-lands in Jura, Mull, Sky, and Lewis, the improveable parts of the Hebrides will, collectively, he found to contain above 700 square miles, or 470,500 square acres, statute measure, being equal in fize to the county of Surrey. Still more important will the Highlands appear, if to the improveable islands and districts of the Hebrides, we add the fertile tracts of the Continent; the vallies, glens, banks of the lakes, and other arable lands throughout that great division of our island; the whole, at a moderate computation, containing more than 2500 square miles, or 1,600,000 square acres; being the dimensions of Middleses, Surrey, and Kent, which compose a twentieth part of England and Wales.

\* When Scotland became no longer the refidence of its Kings.

Extract from Mr. Pennant's Tour in Scotland 1769, and Voyage to the Hebrides 1772, published in 1774.

Jura. This parish is supposed to be the largest in Great Britain, and the clerical duty the most troublesome, and dangerous: It consists of Jura, Colonsay, Oransay, Skarba, and several little islands, divided by narrow and dangerous sounds, forming a length of not less than sixty miles; supplied by only one minister and an affistant.

Ilay. Much flax is raised here, and about £2000 worth fold out of the island in yarn, which might better be manufactured on the spot, to give employ to the poor natives, a set of people worn down with poverty; their habitations, scenes of misery. Notwithstanding the excellency of the land, above £1000 worth of meal is annually imported: a samine threatened at this time, but was prevented by the seasonable arrival of a meal ship; and the inhabitants, like the sons of Jacob of old, slocked down to buy food. The country is blessed with fine manures: besides sea wreck, coral, shell, sand, rock and pit marle. What treasures, if properly applied, to bring wealth and plenty into the island!

Colonfay. Their poverty prevents them from using the very means Providence has given them of raising considerable subsistence. They have a good soil, plenty of limestone, and sufficient quantity of peat; a sea abounding with sish, but their distressed state disables them from cultivating the one, and taking the other. Pass by sour ruined chapels; but notwithstanding from this circumstance, Oransay and Colonsay might be supposed to have been isles of sanctity, yet from the reformation till within the last six years, the sacrament had been only once administered.

Jona. The view of Jona was very picturesque: the east side, or that which bounds the sound, exhibited a beautiful variety; an extent of plain, a little elevated above the water, and almost covered with the ruins of the sacred buildings, and with the remains of the old town, at present in a very ruinous condition.

Arrive at the burying place of Oran: a vait enclosure; the great place of interment for the number of monarchs who were deposited here; and for the potentates of every isle; and their lineage; for all were ambitious of lying in this holy spot. The place is in a manner silled with grave stones, but so overgrown with weeds, that very sew are at present to be seen. I was very desirous of viewing the tombs of the kings, described by the dean of the isles, and from him by Buchanan: the former says, that in his time there were three, built in form of little chapels: on one was inscribed, Tumulus Regum Scotiæ. In this were deposited the remains of forty eight Scottish monarchs, beginning with Fergus II. and ending with the samous Macbeth: for his successor, Malcolm Canmore, decreed, for the suture, Dumserline to be the place of royal sepulture. Fergus was the sounder of this massleum,

(Boethius calls it Abbatia), and not only directed that it should be the sepulchre of his successors, but also caused an office to be composed for the suneral ceremony.

The next was inscribed, Tunulus regum Hiberniæ, containing four Irish monarchs; and the third, Tunulus regum Norwegiæ, containing eight Norwegian princes, or more probably vice-roys, of the Hebrides, while they were subject to that crown. Mr. Frazier, son to the dean of the isles, informed Mr. Sacheverel, governor of the Isle of Man, who visited Jona in 1688, that his father had collected there 300 inscriptions, and presented then to the earl of Argyle; which were afterwards lost in the troubles of the samily. All the tombs lie east and west; the head to the west; probably from a superstition that at the general resurrection, they may rise with their faces to the east.

At present, this once seat of learning is destitute of even a school-master; and this seminary of holy men wants even a minister to assist them in the common duties of religion,

Cannay. At seven o'clock in the evening find ourselves at anchor in four fathom water, in the fnug harbour of the ifle of Cannay. As foon as we had time to cast our eyes about, each shore appeared pleasing to humanity; verdant, and covered with hundreds of cattle: both sides gave a full idea of plenty, for the verdure was mixed with very little rock, and scarcely any heath: but a short conversation with the natives soon dispelled this agreeable error. They were at this very time in such want, that numbers for a long time had neither bread nor meal for their poor babes: fish and milk was their whole sublistence, at this time: the first was a precarious relief, for, besides the uncertainty of success, to add to their distress, their stock of fish-hooks was almost exhausted; and to ours, that it was not in our power to supply them. The ribbands, and other trifles I had brought, would have been insults to people in diffress. I lamented that my money had been so uselessly laid out; for a few dozens of fish-hooks, or a few pecks of meal, would have made them happy".

The crops had failed here the last year: but the little corn sown at present had a promising aspect: and the potators the best I had seen: but these were not fit fot use. The isles I sear annually experience a temporary samine: perhaps from improvidence, or from eagerness to increase their stock of cattle, which they can easily dispose of to satisfy the demands of their landlords, or the oppressions of an agent. Abundance of cod and ling might be taken; there being a fine sand-bank between this isle and the rock Heisker, and another between Skie and Barra; but the poverty of the inhabitants will not enable them to attempt a sishery. When at Campbletown, I enquired about the apparatus requisite, and sound that a

If such he the condition of those who possess the most fertile islands of the Elebrides, how great must be the distress of the inhabitants of the large barren islands, and the greatest part of the opposite continent!

vessel of 20 tuns was necessary, which would cost 2001; that the crew should be composed of 8 hands, whose monthly expences would be 141; that 600 fathom of long line, 500 hooks, and two study lines (each 80 fathom long) which are placed at each end of the long lines, with buoys at top to mark the place when sunk, would altogether cost sive guineas; and the vessel must be provided with sources: so that the whole charge of such an adventure is very considerable, and past the ability of these poor people\*.

The proprietor's factor, or refident agent, rents most of the island, paying two guineas for each penny-land [a small portion of ground, so named from some old valuation]; and these he sets to the poor people at four guineas and a half each; and exacts, besides this, three days labour in the quarter from each person. Another head tenant possesses other penny-lands, which he sets in the same manner, to the impoverishing and very starving of the wretched inhabitants. It is said that the factor has in a manner banished sheep, because there is no good market for them; so that he does his best to deprive the inhabitants of cloathing as well as food. At present they supply themselves with wool from the island of Rum, at the rate of eight pence the pound. All the cloathing is manufactured at home: the women not only spin the wool, but weave the cloth. This island, Rum, Muck, and Egg, form one parish. Cannay is inhabited by 220 souls; of which all, except four families, are Roman Catholics; but in the whole parish there is neither church, manse, nor school: there is indeed in this island a catechist, who has nine pounds a year from the Royal Bounty. The minister and the popish priest reside in Egg; but, by reason of the turbulent seas that divide these isles, are very seldom able to attend their flocks. I admire the moderation of their congregations, who attend the preaching of either indifferently as they happen ro arrive. As the Scotch are oeconomists in religion, I would recommend to them the practice of one of the little Swiss mixed Cantons, who, through mere frugality, kept but one divine; a moderate honest fellow, who, steering clear of controversial points, held forth to the Calvinist flock on one part of the day, and to his Catholic on the other. He lived long among them much respected, and died

Rum. At the bottom of Loch Syriofard, is the little village Kinloch, of about a dozen houses. We entered the house with the best aspect, but found it little superior in goodness to those of Ilay; this indeed had a chimney and windows, which distinguished it from the others, and denoted the superiority of the owner: the rest knew neither windows nor chimnies; yet beneath the roof I entered, I sound an address and politeness from the owner and his wife that were associations: such pretty apologies! for the badness

<sup>\*</sup> See the state of the busses employed in the herring sishery in page 44. Were the natives of these western shores enabled to purchase or build small stout busses for that sishery, the same vessels would also suit the waite sisheries; and, between both, a race of hardy seamen might find employment throughout the whole year.

of the treat, the curds and milk that were offered; which were tendered to us with as much readiness and good-will, as by any of old Homer's dames, celebrated by him in his Odytley for their hospitality. I doubt much whether their cottages or their fare was much better.

The little corn and potatoes raised in this island are very good; but so small is the quantity of beans and oats, that there is not a fourth part produced to supply their annual wants; all the subfistence the poor people have belides, is curds, milk and fish. They are a well-made and well-looking race, but carry famine in their. aspect. Are often a whole summer without a grain in the island; which they regret not on their own account, but for the fake of their poor babes. In the present occonomy of the island, there is no prospect of improvement. The mutton here is small, but the most delicate in our dominions, if the goodness of our appetites did not pervert our judgment: the purchase of a fat sheep was four shillings and fix pence. No hay is made in this island, nor any fort of provender for winter provision. Notwithstanding this island has several streams, here is not a fingle mill. The inhabitants of Rum are people that scarcely know sickness. It is not wonderful that superstitions should reign in these sequestered parts. I must not omit a most convenient species of second fight possessed by a gentleman of a neighbouring ifle, who foresees all visitors, so has time to prepare accordingly.

Here are only the ruins of a church in this island; so the minister is obliged to preach, the few times he visits his congregation, in the open air. The attention of our Popish ancestors in this article delivers down a great reproach on the negligence of their reformed descendants: the one leaving not even the most distant and savage part of our dominions without a place of worthip; the other luffering the natives to want both inflructor and temple.

Skie. Meet great droves of fine cattle, on their way to change of pasture. See a small quantity of very poor flax, railed from the feed of the country, a very unprofitable management. Skie is so divided by branches of the fea, that there is not a place five miles diftant from a port; fuch numbers of good has bours are there in a place destitute of trade, and without a fingle town. Reach Loch Bracadale. Exchange our horses for a boat. Pass over this beautiful land-locked harbour abounding with fale creeks. Cod-fish swarm here in the herring featon pursuing the shoals: a man with a single hand-line caught in three hours as many as were fold for three guineas, at the rate of two pence a-piece. Take leave of several gentlemer, who, according to the worthy custom of these islands, convoyed us from place to place, and never left us till they had delivered us over to the next hospitable roof, or seen us safely embarked,

Skie is the largest of the Hebrides, being about fixty measured miles long; \* the breadth unequal, by reason of the numbers of والمتعالل الشيكان والمتعالل

lochs, that penetrate far on both fides. The quantity of corn raised in tolerable seasons in this island, is esteemed to be about 9000 bolls. The number of mouths to consume them near 13000: migrations, and depression of spirit, the last a common cause of depopulation, having fince the year 1750 reduced the number from 15000, to between 12 and 13000: 1000 having croffed the Atlantic, others funk beneath poverty, or in despair, ceased to obey the first great command, ENCREASE AND MULTIPLY. The wifdom of legislature may perhaps fall on some methods to conciliate the affections of a valuable part of the community: it is unbecoming my little knowledge of the country to prefume to point out the methods. It is to be hoped the head will, while time permits, recollect the use of the most distant members.

Character of the Highlanders. The manners of the native Highlanders may justly be expressed in these words: indolent to a high degree\*, unless roused to war, or to any animating amusement; or I may fay, from experience, to lend any difinterested assistance to the distressed traveller, either in directing him on his way, or affording their aid in passing the dangerous torrents of the Highlands : hofpitable to the highest degree, and full of generosity: are much affected with the civility of strangers, and have in themselves a natural politeness and address, which often flows from the meanest, when least expected. Through my whole tour I never met with a fingle instance of national reflection! their forbearance proves them

in length. Dr. Campbell falls into the same error; and a gentleman who surnished him with some particulars respecting this island, says, that he found it to be eighty miles in length !

\* This remark can only be applied to those who inhabit the interior parts of these deserts, and depend chiefly on grazing of cattle, for the means of sublistence. Where there are no towns, arts, manusactures, harbours, or fisheries, the people, consequently, remain, in a state of inactivity. We have feen the industry of those who inhabit the maritime parts; toiling and labouring by land and water, without ceafing; while the females at home are employed not only in spinning, but in weaving cloaths for the family, of both fexes. We also find great numbers of these people dispersed over the Low Countries; some, in the capacity of menial servants, others, employed in useful arts, particularly at Glafgow, and other manufacturing towns upon the Clyde, where they excel in all the domestic qualities of industry, sobriety, and attachment to their families.

Mr Pennant feems to acknowledge this disposition for industry, at the close of his voyage, where he fays, " The mighty chieftans, the brave and difinterested heroes of old times, by a most violent and surprising transformation, at once sunk into the rapacious landlords; determined to compensate the loss of power, with the encrease of revenue; to exchange the warm affections of their people for fordid trash. Their visits, to those of their foresathers, are like the furveys of a cruel land-jobber, attended by a fet of quick-fighted vultures, skilled in pointing out the most exquisite methods of oppression, or to instruct them in the art of exhausting their purses of sums to be wasted in distant lands. Like the task-masters of Egypt, they require them to make brick without fraw. They leave them in their primeval poverty, uninflucted in any art for their future support; deprived of the wonted resources of the hospitality of their lord, or the plentiful boards of his numerous friends. They experience

G 4

Mr. Pennant must have been misinformed in this particular, as appears by the latest and best maps, wherein Sky does not exceed forty-fix statute miles

to be superior to the meanness of retaliation\*. I fear they pity us: but I hope not indifcriminately. Are excessively inquisitive after your business, your name, and other particulars of little consequence to them: most curious after the politicks of the world, and when they can procure an old news-paper, will liften to it with all the avidity of Shakespear's blacksmith. Have much pride, and confequently are impatient of affronts, and revengeful of injuries. Are decent in their general behaviour; inclined to superstition, yet attentive to the duties of religion; and are capable of giving a most distinct account of the principles of their faith.

Most of the antient sports of the Highlanders, such as archery, hunting, fowling, and fishing, are now disused. The amusements by their fire-fides were, the telling of tales, the wildest and most extravagant imaginable: music was another: in former times the harp was the favourite instrument, covered with leather and strung with wire, but at present is quite lost. Bagpipes are supposed to have been introduced by the Danes: the oldest are played with the

an inflantaneous defertion; are flung at once into a new state of life, and demand the fostering hand as much as the most infant colony. The powers of their fouls are funk with oppression, and those of their bodies lost with want. They look up in despair at the deserted castles; and, worn out with samine and disease, drop into an unnoticed grave. You degenerate progeny of hospitable chieftans, return to your native country; inform the people with your prefence; restore to them the laudable part of the antient manners; eradicate the bad. Bring them instructors, and they would learn. Teach them arts adapted to their climate; they would brave the fury of our feas in fifthing. Send them materials for the coarser manufactures; they would with patience sit down to the loom; they would weave the fails to waft your navies to victory; and part of them rejoice to share the glory in the most distant combats. Select a portion of them for the toils of the ocean: make your levies, enroll them; discipline them under able veterans, and fend annually to their ports the smaller vessels. of your tremendous navy. Trust them with swords, and a small retaining pay. If you have doubts, establish a place d'armer, in vacant times, the deposite of their weapons, under proper garrison. They would submit to any restrictions; and think no restraints, sounded on the safety of the whole, an infringement of liberty, or an invasion of property. Legislature has given them their manumission; and they no longer consider themselves as part of the live stock of their chieftain. Draft them to distant climes, and they will facrifice their lives in the just cause of government, with as much zeal as their forefathers did under the lawless direction of valiant leaders. Limit only the time of their warfare; fweeten it only with the hopes of a return to their native country, and they will become willing substitutes for their southern brethren. Occupied in the fost arts of peace, those should extend your manufactures; and these would defend your commerce. Persuade government to experience their zeal; and let courtly favour rife and fall with their actions."

\* The fame observation may be extended to the whole Scottish nation, who, instead of insulting strangers that reside amongst them from England or elsewhere, pay them a more than ordinary degree of respect. National distinctions are unknown in that country, neither does the appointment of an Englishman, or an Irishman, to a place of profit or honour, give the people any concern.

They even exercife the duties of religion while on board the herring fleets. Every Sunday morning the oldest man in each boat performs to his little audience, the part of a clergyman in, pfalmody, reading the fcripture, and prayer. It is much to be regretted that so many thousands of people thus diffposed, should be deprived not only of ministers, but of books on practical religion, which they are unable to purchase. who are series as decrees a corre-

mouth.

89 )

mouth, the loudest and most ear-piercing of any wind music: the other, played with the fingers only, are of Irish origin: the first fuited the genius of this warlike people, roused their courage to battle, alarmed them when secure, and collected them when scattered. This instrument is become scarce since the abolition of the power of the chieftans, and the more industrious turn of the common

Extract from Doctor Johnson's Journey to the Western Isles of Scotland, 1773, and published in 1775.

I had defired to visit the Hebrides or western isles of Scotland so long that I fearely remember how the wish was originally excited: and was in the autumn of the year 1773 induced to undertake the journey, by finding in Mr. Boswell a companion, whose acutenels would help my inquiry, and whole gaiety of conversation and civility of manners are sufficient to counteract the inconveniencies of travel, in countries less hospitable than we have passed.

Inverness. We were now to bid farewell to the luxury of travelling, and to enter a country upon which perhaps no wheel-carriage has ever rolled. At Inverness therefore we procured three horses for ourselves and a servant, and one more for our baggage, which was no very heavy load. We took two Highlanders to run beside us, partly to shew us the way, and partly to take back from the feafide the hories, of which they were the owners. One of them was a man of great liveliness and activity, of whom his companion said that he would tire any horse in Inverness. Both of them were civil and ready-handed. Civility feems part of the national character of the Highlands.

Near the way, by the road fide, we espied a cottage. This was the first Highland hut that I had seen; and as our business was with life and manners, we were willing to vifit it. To enter a habitation without leave, seems to be not considered here as rudeness or intrusion. The old laws of hospitality still give this licence to a · stranger.

When we entered, we found an old woman boiling goats-flesh in a kettle. Her husband, who is eighty years old, and her eldest boy, were at work in the wood. Her two next fons were gone to Inverness to buy meal, by which oatmeal is always meant. Meal\*

\* Meal from barley and peafe is much used throughout that country, efpecially in years of scarcity, when the people can neither procure oatmeal, nor afford to pay the high price it then brings. When oatmeal fells at a shilling the peck, that from barley and peafe is only eight pence. So late as the year 1750, the medium price of oatmeal was upon an average of four or five years, no more than seven pence the peck; it hath since risen gradually to the average price of one shilling, and was in 1782 at the high price of one shilling and

the confidered as expensive food, and told us, that in spring, when the goats gave milk, the children could live without it. With the true passoral hospitality, she asked us to fit down and drink whisky. She is religious, and though the kirk is four miles off, probably eight English miles, she goes thither every Sunday. We gave her a shilling, and she begged snuff; for snuff is the luxury of a Highland cottage.

Fort Augustus, to Sky. The country is totally divested of its wood, but the stumps both of oaks and firs, which are still found, shew that it has been once a forest of large timber. From our landlord at Anoch we first heard of the general distaits faction, which is now driving the Highlanders into the other hemisphere; and when I asked him whether they would stay at home, if they were well treated, he answered with indignation, that no man willingly lest his native country. Of the farm, which he himself occupied, the rent had, in twenty-five years, been advanced from five to twenty pounds, which he found himself so little able to pay, that he would be glad to try his fortune in some other place. Yet he owned the reasonableness of raising the highland rents in a certain degree, and declared himself willing to pay ten pounds for the ground which he had formerly had for five \*.

We had, by the direction of the officers at Fort Augustus, taken bread for ourselves, and tobacco for those Highlanders who might show us any kindness. We were now at a place (Glensheals) where we could obtain milk, but must have wanted bread if we had not brought it. A woman, whose hut was distinguished by greater spacieusnels, brought out some pails of milk. The villagers gathered about us in confiderable numbers. When our meal was over. Mr. Bolwell fliced the bread, and divided it amongst them, as he supposed them never to have tailed a wheaten loaf before. The woman whose milk we drank, seemed unwilling to take any price, but being pressed to make a demand, at last named a shilling. One of the by-standers, as we were told afterwards, advised her to ask for more, but the faid a shilling was enough. We gave her half a crown, and I hope got some credit by our behaviour; for the company faid, if our interpreters did not flatter us, that they had not feen fuch a day fince the old laird of Macleod passed through their country. At Genelg, where the negative catalogue of provilions was very copious, we had an eminent proof of Highland hospitality. Along some miles of the way, in the evening a gentleman's servant had kept us company on foot with very little no-

tenpence. As oatmeal is the general food of the great body of the people in that kingdom, its price should be so regulated as not to discourage manufactures and commerce. In this view, the medium price should not exceed nine, or at most, tenpences.

Were there towns or markets in the Highlands, the plea for raising rents fourfold might have some soundation in equity; but as there are no towns throughout these extensive and barren regions, an augmentation of cent. per cent. upon rents, in the space of twenty years, ought to satisfy any man who is endued with reason, or the common seelings of humanity.

tice on our part. He left us near Glenelg, and we thought on him no more till he came to us again, in about two hours, with a prefent from his master of rum and sugar. The man had mentioned his company; and the gentleman, whose name, I think, is Gordon, well knowing the penury of the place, had this attention to two men, whose names perhaps he had not heard, by whom his kindness was not likely to be ever repaid, and who could be recommended to him only by their necessities.

Sky. Armidel, the residence of Sir Alexander Macdonald, is a neat house, with a wall'd orchard, shaded by tall ash-trees of a species uncommonly valuable. This plantation deserves attention, because it proves that the present nakedness of the Hebrides is not

wholly the fault of nature.

From Armidel we came at night to Coriatachan, the refidence of Mr. Mackinnon, by whom we were treated with very liberal hofpitality, among a more numerous and elegant company than it could have been supposed easy to collect. The weather was next day too violent for the continuation of our journey; but we had no reason to complain of the interruption. We saw in every place, what we chiefly defired to know, the manners of the people. We had company, and, if we had chosen retirement, we might have had books. I never was in any gentleman's house of the Highlands where I did not find books in more lapguages than one. Literature is not neglected by the higher ranks of the Hebridians.

At the tables where a stranger is received, neither plenty nor delicacy is wanting. Not long after the morning dram, may be expected the breakfast, a meal in which the Scots, whether of the Lowlands or Mountains, must be confessed to excel us. The tea: and coffee are accompanied not only with butter, but with honey, conserves, and marmalades. If an epicure could remove by a wish, in quest of sensual gratifications, wherever he had supped he would breakfalt in Scotland. A dinner in the western islands differs very little from a dinner in England. Their suppers are, like their dinners, various and plentiful. The table is always covered with elegant linen. At the first intermission of the stormy weather. we were informed that the boat, which was to convey us to the island of Raasay, attended us on the coast. We had from this time our intelligence facilitated, and our conversation enlarged, by the company of Mr. Macqueen, minister of a parish in Sky, whose knowledge and politeness gave him a title equally to kindness and respect, and who, from this time, never forsook us till we were preparing to leave Sky, and the adjacent places.

When we came near Raasay, we saw the laird's house, a neat modern fabric, and sound Mr. Macleod, the proprietor of the island, with many gentlemen, expecting us on the beach. Our reception exceeded our expectations. We found nothing but civility, elegance, and plenty. After the usual refreshments, and the usual conversation, the evening came upon us. The carpet was then rolled off the floor: the musician was called, and the whole company was invited to dance, nor did ever fairies trip it with

The family of Raasay confists of the laird, three fons, and ten daughters. For the fons there is a tutor in the house, and the lady is faid to be very skilful and diligent in the education of her girls. More gentleness of manners, or a more pleasing appearance of domestick society, is not found in the most polished countries \*.

This island is like the other islands, I think, generally naked of shade, but it is naked by neglect; for the laird has an orchard, and very large trees grow about his house. Near the house at Raafay is a chapel unroofed and useless; through the four islands which we visited, we neither saw nor heard of any house of prayer, except in Sky, that was not in ruins. If the remembrance of papal fuperstition is obliterated, the monuments of papal piety are likewise effaced. The want of churches is not the only impediment to piety; there is likewise a want of ministers. A parish often contains more islands than one; and each island can have the minister only in its own turn. At Raasay they had, I think, a right to serve only every third Sunday. All the provision made by the present ecclesiastical constitution, for the inhabitants of about a hundred square miles , is prayers and sermon in a little room, once in three weeks: and even this parfimonious distribution is at the mercy of the weather: and in those islands where the minister does not refide, it is impossible to tell how many weeks or months may pals without any public exercise of religion.

At Talisker in Sky, we very happily met Mr. Duncan Maclean, a young gentleman, the eldest son of the laird of Col, heir to a very great extent of land, and so desirous of improving his inheritance, that he spent a considerable time among the farmers of Hertfordshire and Hampshire, to learn their practice. He worked with his own hands at the principal operations of agriculture, that he might not deceive himself by a false opinion of skill, which if he should find it deficient at home, he had no means of completing. If the world has agreed to praise the travels and manual labours of

+ Raasay is twelve miles in length, three in breadth, and contains near one thousand inhabitants.

(93)

the Czar of Muscovy, let Mr. Maclean of Col have his share of the like applause, in the proportion of his dominions to the Empire of Russia. He has introduced into the island the culture of turnips, of which he has a field, where the whole work was performed by his own hand. His intention is to provide for his cattle in the winter. This innovation was considered by a gentleman of the neighbourhood as the idle project of a young head, heated with English fancies; but he has now found that turnips will really grow, and that hungry sheep and cows will really eat them. By such acquisitions as these, the Hebrides may in time rise above their annual diffress. Wherever heath will grow, there is reason to think fomething better may draw nourishment; and by trying the production of other places, plants will be found suitable to every soil \*.

Col. Wherever we rode over the island of Col, we were pleased to fee the reverence with which the people regarded the young laird. He did not endeavour to dazzle them by any magnificence of drefs: his only distinction was a feather in his bonnet; but as soon as he appeared, they forfook their work and clustered about him: he took them by the hand, and they seemed mutually delighted. He has the proper disposition of a chieftan, and seems desirous to continue the cultom of his house. The bagpiper played regularly, when dinner was served, whose person and dress made a good appearance, and he brought no disgrace upon the family of Rankin, which has long supplied the lairds of Col with hereditary musick.

A country that has no money, is by no means convenient for beggars, yet here are some who wander from island to island. We had, in our passage to Mull, the company of a women and her child, who had exhausted the charity of Col. Life is here, in some, respects, improved beyond the condition of some other Islands. In Sky what is wanted can only be bought, as the arrival of some wandering pedlar may afford an opportunity. But in Col, there is a standing shop, and in Mull + there are two. I have in Sky had some difficulty to find ink for a letter; and if a woman breaks her needle, the work is at a stop. There is not in the western islands any collection of buildings that can make pretensions to be called a town, except in the isle of Lewis, which I have not seen. If Lewis is diffinguished by a town, Col has also fomething peculiar. The young laird has attempted what no islander perhaps ever thought on. He has begun a road capable of a wheel-carriage. He has carried it about a mile, and will continue it by annual elongation from his house to the harbour I.

Mull.

This gentleman never forlook the Doctor and Mr. Boswell, till he had lodged them under the hospitable roof of his chief, Sir Allan Maclean of Mull. At this place Sir Allan, at the request of his guests, agrees to accompany them to the famous island of Jona, which lies at no great distance. Just as the com-

<sup>\*</sup> The circumflantial description here transcribed of high-life, in Sky and Raasay, may serve for that of the whole. Hebrides, as related by our learned traveller. He every where meets with the fame manners, politeness, and hofpitality, among the gentry, and the few clergymen with whom he converfed. Of the latter he speaks with particular respect, and seems to regret that men, in whom are combined the gentleman, the christian, and faithful pastor, should profess modes of religious worship different from the church of England.

<sup>\*</sup> In many parts the heath grows to the height of three feet, a certain indication of an improveable foil. See experiments on heathy foils, by Mr. Barclay of Uric near Aberdeen. Pennant's Tour 1772, vol. 2. page 152. An island 35 miles in length, containing 5000 inhabitants.

Mull. This island had fuffered like Sky by the black winter of 1771. Where the climate is unkind, and the ground penurious, forthat the most fruitful years produce only enough to maintain themselves; where life unimproved, and unadorned, sades into fomething little more than naked existence, and every one is busy for himself, without any arts by which the pleasures of others may be increased, if to the daily burden of distress any additional weight be added, nothing remains but to despair and die. In Mull the disappointment of a harvest, or a murrain, among the cattle, cuts off the regular provision; and they who have no manufactures can purchase no part of the superfluities of other countries. The consequence of a bad season, is here not scarcity but emptiness; and they whose plenty was barely a supply of natural and present need, when that slender stock fails, must perish with hunger.

To this foort abstract, we shall subjoin the doctor's humane, and fensible reflections on the present spirit of emigration. There feems now (says he), whatever be the cause, to be through a great part of the Highlands a general discontent. That adherence, which was lately proteffed by every man to the chief of his name, has now little prevalence; and he that cannot live as he desires at home, listens to the tale of fortunate islands, and happy regions, where every man may have land of his own, and eat the product of his

labour without a fuperior.

Those who have obtained grants of American lands, have, as is well known, invited fettlers from all quarters of the globe; and among other places, where oppression might produce a wish for new habitations, their emissaries would not fail to try their persuafions in the isles of Scotland, where, at the time when the clans were newly dismissed from their chiefs, and exasperated by unpre-

cedented exactions, it is no wonder that they prevailed.

Whether the mischies of emigration were immediately perceived, may be justly questioned. They who went first, were probably fuch as could best be spared; but the accounts sent by the earliest adventures, whether true or false, inclined many to follow them; and whole neighbourhoods formed parties for removal; fo that departure from their native country is no longer exile. But fome relate that these adventurous visitants of unknown regions, after a voyage, passed in dreams of plenty and selicity, are dispersed at last upon a sylvan wilderness, where their first years must be spent in toil, to clear the ground which is afterwards to be tilled, and that the whole effect of their undertaking is only more fatigue and equal scarcity.

pany was ready to embark, " we now parted, fays the doctor, from the young laird of Col, who had treated us with fo much kindness, and concluded his favours by configning us to Sir-Allan. Here we had the last embrace of this amiable man, who, while these pages were preparing to attest his virtues, perished in the passage between Ulva and Inch Kenneth.

Some method to stop this epidemick defire of wandering, which fpreads its cantagion from valley to valley, deserves to be fought with great diligence. In more fruitful countries, the removal of one. only makes room for the succession of another: but in the Hebrides. the lofs of an inhabitant leaves a lasting vacuity; for nobody born in any other parts of the world will choose this country for his refidence; and an island once depopulated will remain a defert, as long as the present facility of travel gives every one, who is discontented and unfettled, the choice of his abode.

Let it be inquired, whether the first intention of those who are fluttering on the wing, and collecting a flock that they may take their flight, be to attain good, or to avoid evil. If they are diffatiffied with that part of the globe which their birth has alloted them, and refolve not to live without the pleasures of happier climates, I know not by what eloquence they can be perfuaded, or by what

offers they can be hired to stay.

But if they are driven from their native country by positive evils, and disgusted by ill-treatment, real or imaginary, it were fit to remove their grievances, and quiet their refentment. That they may not fly from the increase of rent, I know not whether the general good does not require that the landlords be, for a time, restrained in their demands, and kept quiet by pensions proportionate to their loss \*.

To hinder infurrection by driving away the people, and to govern peaceably, by having no subjects, is an expedient that argues no great profundity of politicks, To fosten the obdurate, to convince the mistaken, to mollify the resentful, are worthy of a statesman; but it affords a legislator little self-applause to consider, that where there was formerly an infurrection, there is now a wildernefs.

\* This would prove only a temporary remedy at best, for so soon as the pensions were discontinued, so soon would the rents be raised, and all the money thus expended, would be lost entirely to the public, without having produced any permanent effect: It would be better to strike at the evil at once, by bringing these people nearer to the Low Countries, by establishing marts where they might fell their cattle, foul, fish, and the produce of their industry; where, in return they could supply themselves with necessaries for the fisheries, and provision for the winter; where also, they would have opportunities of attending the duties of religion, a circumstance of greater force amongst a religious people than may be imagined, and which would almost extinguish the defire of quitting their native country. Let, therefore, the money which the doctor proposes to grant in pensions, be thus appropriated to more valuable purposes, and emigration will no longer desolate the land.

MONG the benefits arifing from turnpike roads, is that of travelling for health or pleasure over this extensive and beautiful Island. It is an amusement by which an overgrown, luxurious capital, distributes a portion of its superfluous riches through eighty-five counties, and an incredible number of villages, some of whom consider the money thus acquired, as their staple or main support.

On the other hand, the traveller finds his curiofity gratified, his knowledge extended, or his health reftored; while the scenes of penury and distress which often present themselves to view, especially in the countries which we have been describing, will, in the comparison, impress his heart with gratitude towards the Deity, and teach him a lesson of contentment, which, till then, he possibly never had the pleasure of enjoying so completely.

Thus travelling diffuses reciprocal benefits, from the centre, to the most remote corners of Britain; and with a view to this important end, I have drawn up the following Remarks upon that part of the road which is least known, though not the least conducive to health, as all those who have made the experiment, readily acknowledge.

Travelling in the Highlands of Scotland, is no longer attended with the dangers and infurmountable difficulties; the want of necessaries, and other inconveniencies, which deterred our ancestors from visiting these mountainous wilds. The people are studious to oblige. Provisions, especially sish,, tame and wild sowl; small, but delicate beef, mutton and lamb, are plenty, to those who can afford to pay for them; wines, and spirituous liquors, are yet unadulterated in that country; bed, and table linen, far exceed the expectations of every stranger; but these observations are only applicable to the main roads, which are now generally accommodated with carriages.

The best season for an excursion into Scotland, is, from the middle of May, till the first of August. The weather is then generally dry and clear, a circumstance of the first importance to those who travel either for health or pleasure. The glory of Scotland is its picturesque views, and romantic scenery, which, to explore with satisfaction, requires both a clear sky, and ample time: whoever hurries along in a close carriage, arriving late, and setting out early, must return with a very superficial knowledge of the country, and the manners of the people.

There are three roads which lead from England to Edinburgh; that by Berwic, on the east; Wooler in the centre; and Carlisle on the west.

Berwick

( 97 )

Berwick, is fituated on the north fide of the Tweed 335 miles from London, and 53 from Edinburgh. After passing through an improvable country called the Merse, the traveller arrives at Coldingham moor, the eastern extremity of a ridge of hills, which, under various names, extends from Coldingham to the Firsh of Clyde, on the west, thereby crossing the kingdom from sea to sea, and dividing the south of Scotland into two parts. No traveller can therefore reach Edinburgh or Glasgow, without passing these hills; but the trouble of ascending them is amply repaid by the grandeur of the prospects which they command, in the descent northwards.

At the distance of twelve miles from Berwick, the road takes a flanting, north-west direction, on the declivity of the hills, and gradually opens a most extensive view of the north-coast, as far as the promontory of Red Head, in the Shire of Angus. That diftant prospect is, however, soon intercepted by the coast of Fise, which stretches along the north side of the Forth, as far inland as the eye can perceive. The entrance of that noble river is distinguished, on the north fide, by the Isle of May, and on the fouth, by the Bass island, a rock of considerable height, and covered with an incredible number of Solan geefe. The Forth, though only nine miles wide at its entrance, expands within to eighteen miles; contracts at Edinburgh, to five miles; and, at the Queen's Ferry above Edinburgh, to two miles; widens again to near four miles, which it holds for a confiderable extent; is navigable for merchant men as high as Aloa, fifty miles from the sea; and for coasters, as far as Stirling. The Forth was, antiently, the chief scene of commerce and navigation in Scotland, and it is, confequently, lined with towns, fome in ruins, and others beginning to resume the appearance of business. The gentlemens seats, on both sides of the river, are numerous, large, and strongly built.

We must now return to our traveller, who, by this time, is contemplating the pass of the Tees, a deep chasin or glen, over which a bridge of 130 feet in height is now building by subscription. A pleasant, fertile, and populous country, called the Lothians, now opens on every side, through which, a straight, level road of thirty-sive miles leads to Edinburgh. The old custom of enclosing with stone dikes begins to be exploded by gentlemen who have any regard to the ornament of their country, the warmth of the grounds, or the protection of the cattle, from the piercing winds of winter, and the slies in summer \*. Hedge rows interspersed with spiral trees, as beech, larches, aspine, and Luckcombe oak, † would be incomparably preferable, in respect of beauty, utility, and duration.

Edinburgh, the capital of Scotland, being environed on the east fide with hills, no appearances of the city are discovered till the traveller hath arrived at the base of Arthur's seat, where he

Page 107.

H

inds

<sup>\*)</sup> To the want of shade, as well as the want of grass, is owing the leanness of the black cattle in Scotland. In very hot weather they run from place
to place during the greatest part of the day, and thus waste themselves.

† See a full account of this tree in Dodsley's Annual Register, vol. 6.

cular rock, whereon the castle is built.

The houses in the main street are generally five or six stories high in front, and from fix to ten stories backwards, owing to the rapid declivity of the hill on both fides of the street; the whole town exhibiting, at a diffance, the appearance of vast buildings, crowding for protection under the wings of the castle, which rifes majestically to the height of 300 feet, overlooks the whole city, and commands an extensive view of the river Forth, and the adjacent countries.

The views from Edinburgh are its glory; as its incommodious buildings, its narrow dirty lanes (there called closes), are its difgrace. On the north-east fide of the town is the Calton hill, affording a variegated, and most enchanting prospect; but these are lost in the comparison with what Arthur's seat commands. This hill rifes from the lower end of the town, to the height of 656 feet, being nearly double the height of the cross on the top of St. Paul's

London, which is 340 feet.

Edinburgh is fituated on the fouth fide of the Forth, at the diftance of two short miles, and hath thereby the benefit of sea breezes, which, in winter, blow pretty fresh on a city of such elevation. The descent on the north side, terminates in a narrow valley, formerly a sheet of water, called the north Loch. It extends the whole length of the town from east to west, and is bounded on the north by a rifing ground, now connected with the city by a mag-

nificent bridge, whose centre arch is ninety feet high.

This high ground stretches in a parallel direction with Edinburgh; it is a mile in length, flat on the fummit, and hath a gentle descent on each side. Nature could not have formed a place more fuitable for enlarging an over-crouded city; and, consequently, the magistrates in 1767, formed the out-lines of a new town, upon a regular plan of architecture. The houses were to be of stone and flate; commodious, elegant, uniform, and the height limited to three stories. The streets were to be from 90 to 120 feet wide, perfectly straight, and to cross each other at right angles. The north Loch, at prefent an unwholesome quagmire, was to be formed into a canal, bordered by a terrace walk, and the ascent to the new town ornamented with shrubberies, &c. A plan of this intended feat of elegance was published on copper plate, and lots of ground were immediately taken by the nobility, gentry, and principal inhabitants, upon building leafes.

Thus far the business was conducted with talte and judgment. But when gentlemen had begun to build elegant houses on the faith of the new plan, they were surprised to find the spot, appointed for terraces and a canal, beginning to be covered with mean irregular buildings, and work-houles for tradefinen." Thus the magistrates, not contented with an increase of revenue both sudden ( 99 )

and unexpected, had nearly ruined the town, by deviating from the elegant plan which they themselves had published. The consequence was a fuit before the house of peers, in which the Magistrates were cast, with loss and disgrace; besides the mortification of having the management of this bufiness transferred to the hands of the Lord President of the Court of Session, and the Lord Chief Baron of the Exchequer.

The raifing of this new city upon the most magnissient design, is a matter of the greatest consequence to the whole nation, as it will draw a refort of company, and confequently an influx of money, to that inpoverished part of the island. Of this, there is not the smallest doubt; for, notwithstanding some deformities, owing to the tasteless absurdities of the magistrates, it surpasses, upon the whole, any pile of buildings in these kingdoms, of the same extent.

One half of the high ground is already covered; and, in a few years, the whole will be engaged. The original plan, which was drawn by an ingenious architect, is so judicious in all its parts, as to preclude the possibility of improvement thereon, one instance. excepted, which experience hath pointed out to be highly expe-

The main streets, which run the whole length of the town, from east to west, are three; viz. Prince's street, which, having a fouthern aspect, faces the old town; Queen-street, which, having a northern aspect, faces the river Forth; and George street in the centre. The first and last mentioned streets confiit of one row of houses only; consequently, the very elevated, and open situation of those streets, expose the inhabitants to the cutting winds, and violent storms, of that northern climate.

As a remedy to this inconvenience, let the descent from those ffreets be planted with quick growing spiral trees, of the most ornamental species; these, in a tew years, will rise above the level of the streets, and gradually skreen the first stories; while the fummit may be planted with double rows of trees, so as to protect the upper stories of the houses from the cold blasts of winter, and afford a most agreeable shade in summer. Trees, thus disposed, will correct the air, embellish the town, and form a convenient, healthful walk to the inhabitants. All schemes of covering the open fide of these streets with houses, or shops, to the height of one story, as proposed by an anonymous writer, ought to be considered as the delusive projects of interested persons, more attentive to private views, than the ornament, and benefit of their country.

As this new town is circumscribed on every side, excepting the north, it would be expedient in the magistrates to have a view to the purchase of lands towards the Forth, and Leith water, whereon to mark the lines of regular streets, to be carried forward, in straight directions, to these rivers. Edinburgh begins to surmount its misfortunes, in the loss of the court and parliament; manufactures and commerce, the true fources of wealth, are again refumed, and bid fair to extend the capital as far as those waters will permit.

Besides the benefits of an increasing commerce, this city is confidered as the modern Athens, in politeness, science, and literature. The writings of its professors, divines, and lawyers, are every where read, and admired. In the healing art, it hath no equal. A seminary thus celebrated, must naturally bring thither many students from various parts of Europe and America; a consideration which assorbed arguments in tavour of open airy streets, and commodious low houses, surnished, where practicable, with small gardens.

The distance from Edinburgh to Perth is forty miles, almost due north. The first object that presents itself is the river Forth, which may be crossed at Leith, where it is seven miles over, or at the Queen's Ferry, nine miles above, where the passage is only two miles. Both of these roads unite at Kinross, a pleasant town on the banks of Loch Leven, a lake of twelve miles in circumference, ornamented with woody islands, on one of which, the unfortunate Mary Queen of Scots was imprisoned by her subjects. Thus far the country is very fine, and well improved; consisting of gentle risings, and rich crops of grain, but without those hedgerows, interlined with trees, which ornament the plains of the fouth.

From Kinrofs, the country assumes a mountainous appearance, very proper for sheep, but injudiciously cut up, in many parts, for the raising of slender crops of grain, a custom too prevalent throughout the whole kingdom of Scotland.

The descent from these hills opens a view of Stratherne, a rich valley, 30 miles in length; bounded on both sides by verdant sheep-walks; interspersed with the seats of nobility and gentry; and beautissed by the numerous windings of the river Erne. Cross the bridge, and ascend the base of Moncrief hill, commanding an extensive prospect of Perth, the Tay, and the Grampian mountains.

This is the shortest, and most usual road to Perth; but travellers, who wish to see the remains of a city, celebrated formerly for science and commerce, must, after their passage from Leith, keep along the east-coast of Fiseshire, till they arrive at St. Andrews, whose ruins, at a short distance, exhibit a picture of Gothic magnificence, and Christian barbarity.

The town consisted of four streets of considerable length, and proportionable breadth, running parallel to each other, in straight lines. Three of the streets still remain; of the fourth, hardly a vestige is to be seen. Further particulars, respecting this sallen city, would be painful in the recital.

After passing through an open country of nine miles, the traveller arrives at the banks of the Tay, where that river is two miles in breadth; it widens above, to three miles; and is navigable for coasting vessels as high as Perth, from whence much salmon is exported to London. The serry can only be crossed after half slood, when stout boats are continually plying for passengers to Dundee, a handsome town, finely situated for trade, and long celebrated for the commercial spirit of its inhabitants, who are equally distinguished for their taste, in whatever relates to ornament, or utility.

The distance from Dundee to Perth is twenty-two miles, through the Carse of Gowrie, esteemed the garden of Scotland, but which, its envious neighbours say, is denied fire in winter, water in summer, and the grace of God all the year. There are two roads through this delightful spot; the lower and the upper. The lower road is upon the edge of the Tay, and hath a near view of the opposite coast of Fise, which rises in a gentle ascent from the water, and in beauty and sertility is little interior to the northern shore. The upper road commands one of the richest views in Great Britain, and is consequently preferred by all those who travel for health or amusement. It is carried along the margin of the Gowrie hills, whose sloping sides are every where covered with rich sields of wheat, clover, or thriving plantations.

Within a few miles of Perth, these hills begin to close upon the river; the terrified stranger finds himself invironed by losty impending precipices, cloathed however to a considerable height with natural woods; a specimen of the rude magnificence so trequent in the Highlands, which is now at no great distance.

Perth stands upon the west side of the Tay; it consists chiefly of two handsome streets; is, upon the whole, an elegant town, and admits of great improvement. Its shady walks on the banks of the Tay, the opposite hills covered with rising plantations, the handsome bridge, from whence there is a view of an extensive plain bounded by distant mountains, compose a justly admired landscape.

But no traveller, who is not in a deep decline, should leave this place, until he hath ascended the hill of Moncrief; where, having gained the summit, his labour will be amply repaid. Vain would be the attempt of the most fertile imagination, to display, by description, the scenery which that hill commands. The soft, and the rude touches of nature, are so finely blended, that the eye alone, can delineate them.

On leaving Perth, the Grampian mountains appear in full view, stretching in a north-east direction, from Lochlomond to Aberdeen; having in front, the valley or plain of Strathmore, of confiderable extent and fertility; the great theatre of Scottish valour, in defence of their country and liberties; and is therefore styled, by way of preeminence, classic ground. The Caledonians had long beheld, with deep concern, the encroaching spirit of the Romans, in Britain; their vigilance, perseverance, and progressive conquests, from the Thames northward, till they arrived at the base of these mountains. Here the Caledonians, seeing themselves invested by sea and land, with a view to the complete conquest of the island, made vigorous preparations, to check the further progress of those hostile intruders. Having collected the force of the nation, and lodged their wives and children in places of fecurity, they marched forward in good order, and with a bold countenance, till they came within fight of the Roman legions, whom they no longer considered as invincible. While Agricola was animating his victorious legions, exhorting them to put an end to a flruggle of fifty years with one great and important day, the royal Caledopian pathetically addressed his countrymen, in a speech of considerable length, of which the following abstract, from Tacitus, is

here inserted, as a specimen:

" Against their pride and ambition (faid he) you will in vain feek a remedy or refuge from any obsequiousness or humble behaviour. These plunderers of the earth, these rayagers of the universe, finding countries to fail them, endeavour to rise the wide feas and the ocean. If the enemy be wealthy, he inflames their avarice; if poor, their ambition. Neither the eaftern world, nor the western, vait as they are, can satiate these general robbers. Of all men, they alone thirst after acquisitions, both poor and rich, with equal avidity and passion. Devastations, murders, and universal destruction, they by a lying name style empire and government; and when they have spread a general devastation, they call it peace. Dearest to every man, by the ties of nature, are his children and kindred. These are snatched from us to supply their armies, and doomed to bondage in other parts of the earth. Our wives, daughters, and fifters, however they escape violence from them as from open enemies, are debauched under the appearance of friendship. Our goods are their tribute, our corn their provision, our bodies and limbs their tools for the drudgery of making cuts through woods, and drains in bogs, under continual blows and outrages.

"The Brigantes \*, even under the conduct of a woman, burnt their colony, stormed their entrenchments, and, had not such auspicious beginnings degenerated into floth, might have with ease cast off the yoke and recovered their former liberty. Let us, who are yet unsubdued, who still preserve our forces intire, and want not to acquire, but only to secure, liberty, shew at once, in the very first encounter, what kind of men Caledonia has reserved for her own vindication and defence. Here you see a general, here an army; there tributes and mines, with a long train of calamities and curses, ever attending a state of slavery. Whether all these are to be for ever imposed and borne, or we forthwith avenge ourselves for the attempt, this very day must determine. As therefore you advance to battle, look back upon your ancestors, who lived in the happy state of liberty; look forward to your posterity, who, unless you exert your valour in this very field, must live for ever in a

miserable state of servitude."

Many battles were fought in this struggle between the thirst of empire, and the love of freedom. The Roman legions, more through their military knowledge, than superior bravery, generally prevailed; but the Caledonians, aided by their mountains and moraffes, though often defeated, were never completely subdued. What the Romans could not, therefore, acquire by the sword, they endeavoured to accomplish by policy. Having stationed themselves in the centre of the kingdom, as appears by the camps

( 133 )

still visible in the front of the mountains, they created a distinction between the Caledonians of the east, and those of the west side of the country. To the former, they gave the name of PiEi; to the latter, that of Scoti. In order more effectually to divide the nation against itself, they prevented all social intercourse, somented jealousies, and encouraged feuds, themselves acting as auxiliaries, as

occasions required, and prudence dictated.

When the Romans were called home, in the fifth century, to defend the centre of their tottering empire, against the unceasing attacks of Goths, Vandals, and other Barbarians; the two nations of Scots and Picts, who had long been the tools of Roman policy. became, in their turn, zealous, not for freedom, but for conquelt. Those plains remained the theatres of fierce conflicts, till the middle of the ninth century, when the Scots finally prevailed, and the whole country, now re-united under one monarch, took the name of Scotland. The feat of government was transferred from Rothfay. Dunstaffnage, Inverlochy\*, and other casties of the ancient Scottish princes, to Scone, and its neighbourhood, as being more inviting, and also more centrical and commodious, for repelling the ravages of the Danes, a people who had carried terror and defolation throughout the whole kingdom, but more particularly the eastern coast facing the Baltic. Those districts were, therefore, still devoted to the rage of war, which was rendered more destructive, from the aversion of the Danes to Christianity. The Scots proved generally victorious; and, at length, the invaders, tired out with fruitless enterprises, abandoned their precarious conquests, about the middle of the eleventh century, during the reign of the famous Macbeth. No place therefore, in Britain, affords fo great a variety of antient remains; fuch delicious morfels, whereon the antiquary may gratify his curiofity, and the critic display his learning t.

Twelve miles from Perth, the traveller arrives at the noted pass of Birnam wood, and must bid adien, for a while, to verdant hills, extensive plains, and populous towns. The scene changes instantaneously to losty mountains, covered with heath, or natural woods; to narrow vallies, winding streams, and extensive lakes. Wherever he directs his course in the Highlands, he is accompanied by wood and water. Every valley (called in that country frath or glen), hath its ffream meandering from fide to fide, and dividing the whole into a number of little verdant peninsulas. The beds of these rivers, are fand or pebbles, barely covered in fummer, but which, during the autumnal and winter floods, feem scarcely sufficient to contain the great body of water that rolls along with frightful impetuofity. When, upon a thaw of fnow, every mountain pours forth its tri-

+ They confift chiefly of Roman encampments, at Strageth, Ardoch, Comerie, and Delvin. Roman highways are also visible in many parts, connecting the different encampments and the lesser stations.

<sup>\*</sup> The Brigantes inhabited Yorkshire, Lancashire, Durham, Westmoreland, and Cumberland. They made, a brave defence, under Queen Boadicia, and were the last of the South Britains who submitted to the Romans.

<sup>\*</sup> There still remains a fragment of the castle of Rothsay, and a considerable part of Dunstaffnage. They are conjectured by antiquaries, to be nearly coeval with the Romans in this island. The castle of Invertochy seems, by its architecture, to be of later construction.

Caledonian fortresses. These were generally placed on, or near, the summits of the Grampian hills, and commanding extensive views of the vallies underneath. They were surrounded with ramparts formed of loose stones, having entrenchments or ditches on the outside. Here the Caledonians lodged their women and children in times of danger, while the young and the brave gave battle to the Romans. The most conspicuous of these posts are at Blairgown, the two hills of Catter thun, and Denoon castle.

He florical pillars or obelifks. These are both instructive and curious. They were erected in commemoration of signal victories gained by the Scots over the Danes, and are generally ornamented with a rude sculpture, or has relief of men on horseback, and other emblematical sigures and hieroglyphics, which have been accurately described by the antiquaries of the last and present century. These obelisks derive a particular consequence from their being found upon this north-east side of Great Britain, and no where else. Some of these stones are erected at Aberlemni near Brechin. Other pillars of curious workmanship, representing chariots, horsemen, human sigures, animals, and centaurs, are found at the village of Meigle. The death of Malcolm II. at Glamis, is represented on various stones near that castle.

Round torvers. These are supposed to be of Pictish construction, but their uses have not reached posterity. There are only two columns of this singular architecture in Britain, viz. one at Abernethy near Perth, whose height is 72 feet, and circumference at the bottom 47 feet. The other tower is at Brechin; its height is 103 feet, its circumference near the bottom 48 feet; the thickness of the wall at that part is seven seet two inches, and at the top, four seet fix inches

The Palace of Scone. Kenneth II. upon his conquest of the Picts in the ninth century, having made Scone his principal residence, delivered his laws, called the Macalpine laws, from a tumulus, named the Mote Hill of Scone. The same prince conveyed to this place from Dunstaffnage, the coronation chair of his predecessors, and here it was used for that purpose by his successors, down to the year 1296, when Edward I of England carried it to London, to the great mortification of the Scottish nation. Their kings, however, continued the practice of being crowned here till the reign of Charles II. the last monarch who honoured Scone with that ceremony. Mr. Campbell of Dunftaffnage, has a small ivory image of a monarch sitting in this chair, with a crown on his head, a book in his left hand; and, feemingly, in a contemplative mood, as if he was preparing to take the coronation oath. His beard is long and venerable; his dress, particularly his robe edged with fur or ermine, is distinctly represented. The figure was found among the ruins of Dunstaffnage, and being, consequently, engraved before the conquest of the Picts, it is to be confidered as one of the greatest curofities now in the island. It corroborates the few remains of antient Scottish records; it represents the dress of those early times; and, it discovers a knowledge of the art of sculpture, wherein the Scots feem to have made confiderable proficiency, of which the above-mentioned historical stones, are visible proofs. Of the Royal Palace of Scone, the abbey, church, and other magnificent buildings, nothing now remains; they were completely destroyed in the year 1550, when there ensued, says Bishop Spotswood, a pitiful devastation of churches, and church-buildings, throughout all parts of the kingdom.

Birnam Wood, and Dunsinane. The place called Birnam Wood is a lofty hill on the west side of the Tay, immediately on the entrance of the Highlands. Dunsinane is a small; but steep hill on the east side of the Tay, on the summit of which. Macbeth built and fortified his imaginary impregnable castle, as a place of security against the attacks of his rival Malcolm III. No part of the building now remains; but the ditches which surround its æra are still visible. The neighbourhood abounds in tumus and other antiquities.

( 105 )

grain. Bridges, especially those of modern construction, are thrown down, trees are torn away, and even stones of considerable weight yield to the pressure of the torrent.

All the accumulating waters, from every direction, in a circuit of fifty miles, are received by the Tay; and this noble river, after collecting the various streams of the centre of the kingdom, falls into the sea below Perth. A river so considerable must, at proper seasons, facilitate the floating of timber, from the glens, and interior parts of the Highlands; of this favourable circumstance the gentlemen of those parts seem now to be duly sensible. Its banks afford a rich prospect of suture wealth, arising, in many places, from grounds which could not otherwise be brought into use.

The Tay flows from the north, and receives at Dunkeld the river Bran, whose picturesque banks, improved by art, contribute greatly to the beauties around that elegant seat. The road northward, hath already been described, as an accumulating treasure to the noble proprietor, and extremely pleasant to the traveller. At Logyrait, eight miles above Dunkeld, the Tay and the Tumel unite their copious streams. The natural beauties of this place are disgraced by a mean village, which, though the station of two ferries, hath neither inn nor stable.

From Logyrait northward, the fine scenery of art and nature continues as far as Blair, a residence of the family of Athole during the hunting season.

Thriving plantations, picturesque walks, cut with great labour, expence, and perseverance, through rocks, and impending precipices, over glens darkened with timber; a series of five natural cascades, forming upon the whole near 200 feet in height, abundantly repay the traveller, whose curiosity leads him thus far into the Highlands.

From Blair northward, there are two roads; one leading to the pleasant shire of Murray; the other to Fort Augustus, and Lochaber, now Fort William. Neither of these roads being passable tor carriages, travellers, whose business or curiosity leads them to the north of Scotland, generally go by the lower or eastern road through Aberdeenshire.

Blair, is therefore, the most northerly slage of the Short Tour of Scotland; the traveller hath no choice of returning by another road to Logyrait; nor will he, after a second review of this romantic country, be forry for the disappointment. Logyrait, situated at the constant of the Tay and the Tumel, is also the centrical point where the roads from Dunkeld, Blair, Taymouth, and other parts of the Highlands, unite. From this place the traveller now proceeds wellward, along the north side of the Tay, which winds, in considerable reaches, through a beautiful valley sisteen miles in length, called Strathtay, abounding in grain, meadows, and plantations. The water which glides through this fine tract receives, on the north side, the river Lion, two miles below Taymouth, the seat of the earl of Braedalbane, already described, but all description sails in the attempt to convey suitable ideas of its magnificence.

The west end of this lake exceeds, in the opinion of some perfons, all the scenery of Dunkeld, Blair, or Taymouth. Here the Tay, and the Lochy, seem emulous in displaying their respective

beauties, before they are blended with the lake.

The views of these rivers; of the lake, the islands, and the towering mountains, discover, every where, the patriotic hand of the late earl of Braedalbane; to whose muniscence, the public are also indebted for the roads, the bridges, and the commodious

inns of this extensive, but townless region.

Here, at Killin, the traveller may confider himself in the centre of Scotland, and nearly at the medium distance between Dunkeld and Lochlomond, the two main openings into the Highlands, from the fouth. The road still leads westward, through Glendochart and Strathfillan, watered by the Tay, which hath its source amidst tremendous mountains, whereon stands the inn of Tyndrum, remarkable for being the most elevated habitable situation in the kingdom. The waters now take a western direction through the little vale of Glenurchie, till they are lost in Lochawe, a narrow sresh-water lake, twenty-four miles in length, shaded on the west side with wood, and ornamented with twelve small islands, whereon are the ruins of a convent, and two castles. At Lochawe, the traveller is at the western boundary of his journey, and at no great distance from the Atlantic ocean, and the Hebride islands, which may be seen from the summit of the hills.

Having thus nearly crossed the kingdom from sea to sea, he returns towards the fouth-east direction, and soon arrives at Inverary, pleasantly situated on a small bay, formed by the junction of the river Aray with Lochfyne. This place hath long been the principal refidence of the family of Argyle, whose heroic deeds and steady patriotism make a conspicuous figure in the history of their country. The present seat is a modern construction, begun, and completed, by the late Duke Archibald, who also formed the defign of an entire new town, upon a commodious, elegant plan, becoming the dignity of the capital of Argyleshire, a country most admirably fituated for manufactures and the fitheries. Of this circumstance, the present duke seems to be fully sensible; the town is rebuilt conformable to the original plan; manufactures are introduced and patronifed; roads and bridges are every where formed; agriculture, planting, and the raifing a better breed of sheep, are every where encouraged.

We cannot quit this subject without remarking the comparative, happy situation of mankind, under the three noblemen, whose contiguous estates occupy the greatest part of a tract, extending from the borders of Aberdeenshire, to Campbleton, and the western ocean.

Emi-

( 107 )

Emigration, fo fatal to that kingdom, and to Britain, is scarcely known upon the estates of Argyle, Athole, and Braedalbane; an infallible proof of judicious measures, and humane usage.

Invergry is fituated within a day's journey of the Low Countries: but travellers, who incline to vary the scene, will make a previous excursion, for a few days, to the peninsula of Cantire. The first part of this journey is carried along the east side of the peninsula, bounded by Lochfyne, as far as the Tarbat, where the neck of land is only one mile in width. From this place, the road crosses to the west side of the peninsula, washed by the Atlantic, of which the traveller hath an unbounded view, there being no land between that coast and North-America. The south Hebrides now appear at the distance of a few miles, some, rising above the clouds; others, almost level with the sea. On the east side of the peninsula, is the opening of the Clyde, bounded, at the distance of thirty miles, by Airshire, and Galloway. Nearly in the centre of this narrow fea, the rock or craig of Ailfa rifes, in the form of a fugar loaf, to a great height. Its inhabitants are folan geefe, and other large birds, who live on the bounty of the fea, The fouth prospect lays open the entrance into the Irish Channel, and an extensive view of Ireland. Here, therefore, the traveller, now placed at the extremity of a narrow, but far projecting flip of land, hath a full view of the Atlantic, the Irish channel, the mouth of the Clyde, the kingdoms of Scotland, and Ireland, with the fouth Hebrides; prospects, easier to conceive than describe.

The passage between Cantire and Castle Cary in Ireland, is usually performed by serry boats, in three or sour hours; and from Cantire to the Giants Causeway, in the space of half a day. Those who choose to return to Inversry by water, may be supplied with a boat at Campbleton, a handsome trading town, lying at the bottom of a fine bay, on the east side of Cantire. They will coast along the lofty isle of Arran at the entrance of the Clyde, and from thence up Lochsyne, where they may land at pleasure.

Imprest with the sublime grandeur, and yast expanse, of these views, the traveller will now behold the beauties of the little Highland capital, with diminished rapture; still less will he, after passing round the head of Lochfyne, be elevated with the gloom and nakedness of Glencroe, the most neglected tract throughout the whole tour, though extremely proper for various species of planting, which would here find an easy and cheap conveyance by water.

Having emerged out of this folitary glen, he finds himself in view of Loch Long, a salt water lake, twenty-two miles in length, communicating with the Clyde, facing Greenock. This lake is the eastern boundary of Argyleshire, a portion of which county, and of Perthshire, composes the whole route of the traveller, since his departure from Dundee.

After passing through a little fertile tract, ornamented with planting, upon the head of Loch Long, the traveller enters Dunbartonshire; and, at the distance of a mile, arrives at East Tarbat, situ-

atec

the forface of the water.

The elevation of the road, from the Tarbat fouthward, contributes greatly to the pleasure of the traveller, especially after passing the point of Firkin, which instantaneously opens the wide expanse of the lake, and all the luxuriancy of its woody islands, and deep indented shores; fertile, verdant, and every where fringed with wood. On the edge of a small bay, is the seat of Sir James Colhoun of Luss, who inherits, through a long series of ancestors, the greatest part of these picturesque domains.

The outlet of this lake forms the beautiful water of Leven, celebrated, in foft pathetic lines, by Dr. Smollet, to whose memory an obelisk hath been erected on its banks, near the place where that benevolent friend of mankind first drew breath. This river glides in a copious stream over a pebbly bottom, till it joins the Clyde, sive miles below. It abounds in salmon and trout; its banks form one continued wood, intermixed with villas, meadows, and corn fields. Here also, the manufacturers of Glasgow, induced by the qualities of the water, have established the greatest bleacheries in that kingdom.

These appearances announce, to the traveller, his return to the Low Countries, to which Dunbarton, an antient, decayed royal borough, is the western entrance. Here the Leven, navigable for vessels of 200 tons, falls into the Clyde, where the latter is a mile wide. At the point or angle, formed by the junction of these rivers, a perpendicular, double pointed rock, rises to a great height, and hath been occupied, from the earliest annals of the Scottish history, as a castle, and armory. The natural situation of this castle, at the constax of two navigable rivers, gives it a most extensive and variegated prospect over the shires of Rensrew and Dunbarton, which it fully commands; part of Lanerkshire, wherein are seen, at the distance of sisteen miles, the numerous spires of Glasgow; Cowal, in Argyleshire; and the crouded summits of the Grampian mountains, in Perthshire.

The road from Dunbarton to Glasgow, though mostly on a level, is uncommonly delightful. It is carried along the north side of the Clyde, and hath throughout, an extensive view of Rensrewshire, which forms the southern shore. At the distance of a full mile from Dunbarton, commences a ridge of hills, which, under various names, extends, in a north-east direction, to Stirling. Of these hills, Dunbuck is the western extremity. It rises immediately from the road, with such awful majesty, that romance itself cannot sigure a nobler object. Eastward, the hills rise to a still greater height,

height, and are cloathed for a short space with oaks, which are cut down every twenty years, for the bark.

At the distance of three miles from Dunbarton, where the hills dip into the Clyde, barely leaving a passage for travellers, was begun, or ended, the famous Roman wall, vulgarly called Graham's Dyke; from Graham or Grimus, (governor of Scotland, during the minority of its prince), who, upon the departure of the Romans in the fifth century, broke through the northern barrier, drove back the trembling Britons, and recovered the southern division of the kingdom, which the Romans had long usurped\*.

At the distance of half a mile eastward, the road, rising in a gentle ascent facing Erskine house, a feat of Lord Blantyre, astonishes the traveller with the grandeur of its views. Here stands Kilpatric, or Cell Patric, so named from its being the birth-place of the famous St. Patric, a clergyman of this place, asterwards the apossle of Ireland. Every real or imaginary event of remote antiquity, hath its tradition: St. Patric, while sishing on a small rock in the Clyde, facing this place, was seized by Irish pirates, and carried to their country, where he became a great man. From this circumstance, the rock is called Patric's Stanc. At Dunbarton, a fair held in March, is called, in honour of the Saint, Patric's Mass fair.

Hitherto the road displays a full view of the wide expanse of the Clyde; the picturesque intermixture of hills, woods, seats, and plantations. To the grandeur of this western prospect, a gentle elevation, after leaving Kilpatric, lays open the soft scenery of the Clyde towards Glasgow, whose spires make a conspicuous sigure in the landscape. South-east, at the distance of sive miles, is a sull view of Paisly, a large, irregular town, remarkable for its gauze manufactures, which adorn the heads of the British ladies, and even those of Paris, as appears by the commissions sent from that capital. From this hill, to Glasgow, the road is straight and level; the villas are numerous; the farm-houses, small but neat; the fields inclosed in the true stile of judicious husbandry. These pleasing objects denote the neighbourhood of a large commercial city, striving to correspond, in taste and elegance, with the beauties of its environs.

Glasgow owes the regularity of its streets to a fire, which, in 1652, burnt one third of the city, including 80 warehouses, and the habitations of 1000 samilies. This calamitous event, is recorded in a letter from Colonels Overton and Blackmore, to Oliver Cromwell, and by which it appears that Glasgow contained from 15 to 20,000 people, amongst whom were some wealthy merchants.

Unfortunately for this, and all the towns in Scotland, the builders have copied the Gothic, unhealthy, and most inconvenient practice of the French, instead of the clean, the decent, and commodious dwellings of England, where the whole building is occupied by one tenant only. From this error, in the re-building of Glasgow, that city is, at present, a medley of beauty and desormity. The

<sup>\*</sup> From this hero is descended the illustrious house of Montrose.

houses have, outwardly, an appearance of elegance; the streets are, mostly, straight and wide; but the town is disgraced by its narrow, unwholesome lanes, or close; by the inconveniences of an over-crouded population, every house being inhabited by various families, and of various ranks in life. The builders had no conception of small neat houses; from twenty to twenty-five seet wide, containing a kitchen and cellars under ground; a shop, parlour, and yard; a first floor for letting out to occasional lodgers; a second and third floor for the samily. Neither did they discover, the utility of open, airy courts, and back streets, for the residence of clergymen, lawyers, and other professions that do not require shops.

The principal inhabitants, sensible of the mistakes of former times, and willing to repair them, have lately built feveral small fireets composed of private houses only. These dwellings are commodious, substantial, and elegant; accommodated with gardens, offices, and all the conveniences of a country feat. Perfection, however, is not the work of a day, or year, but of long observation, and gradual experience. While a stranger admires the elegance of these new buildings, he is greatly disappointed in the appearance of the streets. This is owing to the irregular position of the houses, some, being placed forwards; others, a confiderable way back. Neither hath any regard been paid to uniformity in the colour of the stone, every person consulting his own fancy only, in the position of his house, and the materials of which it was to be composed: irreparable injuries to the elegance of the town, and will be regretted by posterity. One street, however, hath hit, fortunately, upon fymmetry and proportion, the good effects of which are perceivable at first fight.

Nature hath been remarkably favourable in respect of situation, whereon to extend the present emporium and ornament of the north. The town is bounded southward, by the Clyde; northward, by a gentle ridge of hills, lying in a parallel direction with that river. These two natural boundaries scarcely admit of any mistake in projecting new streets; yet, if unassisted by a spirited magistracy taste and judgement, mistakes may, and will happen. Every builder will consult his own convenience; and thus a spot, formed by nature for health and ornament, will be obscured, and irretrievably lost to the community. It would therefore be expedient to lay out, upon a regular plan, the whole from of the rising ground from the High-street to Anderston, and even beyond that village \*. A city, so distinguished for the industry and ingenuity of its inhabitants, the variety of its manufactures, and the extent of its commerce, should look forward, with an invariable view to magnificence, and national honour.

\* It might be proper, for the information and conveniency of the infiabiliants, to publish on copper-plate a handlome plan of the town, including the proposed additions, and the western environs; as far as the Kelvin, a river which, in less than half a century, may become the boundary on that side.

( 111 )-

The great ornament of Glasgow is its very respectable and much-frequented university, whose professors have long been eminent in the various branches of science, and classic education. This seminary stands on a rising ground, close upon the country, and is possessed of a large garden for the conveniency of the students; adjoining to which is a botanic garden, an observatory, and a hand-some, well-furnished library.

When the Romans raised the well known northern barrier against the Caledonians, commonly named Graham's dike, they erected stones with inscriptions, which denote that certain parts of the work were made by detachments of such and such legions. These stones have been collected by the University, together with alters, and other monuments of Roman greatness, which are highly entertaining to the antiquary.

About thirty years ago, a fon of the family, which is the head of the Clan Macfarlane, made a valuable present of astronomical instruments to this University. And, in 1783, Dr. Hunter, late physician to the Queen, bequeathed to it his famous anatomical preparations, library, and museum, which will be a benefit and ornament not only to this place, but to the whole kingdom.

The editions of the classics which were printed under the inspection of the professors, with the types of the ingenious Mr. Wilson, and by the celebrated Messrs. Foulis, are held in such esteem abroad as to sell nearly at the price of antient manuscripts. His present majesty when Prince of Wales, Archibald duke of Argyle, and many other persons of taste and learning, patronised these elegant editions.

Nor must I, as a well-wisher to science, and useful arts, forget to mention the apparatus for natural philosophy in this University, it being unanimously esteemed the most extensive and most useful in the world. It was brought to that perfection at the expence, and by the unremitting labour of Mr. Anderson, who not only gives lectures on the mathematical and scientific parts of natural philosophy to those who are designed for learned professions, but who likewise gives separate lectures to artists and manusacturers, in the most simple and engaging manner.

At the north extremity of Glasgow stands its magnificent cathedral, the only entire building of that description now in Scotland. It owes its preservation to the spirit and good sense of the tradesimen, who in 1579, upon hearing the beat of drum, for collecting the workmen appointed to demolish this venerable edifice, slew to arms, and declared, that the first man who pulled down a single stone should that moment be buried under it. No monument hath been erected to the memory of those virtuous citizens.

There are two main roads leading from this city to Edinburgh; the fouth road, confissing of forty-four miles, through a level, and in general a well-improved country: and the north road, which, though fifty miles in length, is generally prefered, on account of its views, and the towns through which it passes, or which are contiguous.

The distance by this road to Stirling is twenty-eight miles, thro' a broken, rough country, very little indebted to modern improve-

ments. The ridge of lofty, verdant hills before-mentioned bound the northern view. On the fourh, the road is enlivened by the navigation of the great canal, defigned to open a communication for coasting vessels, between the rast and the west seas. Next to the navigations completed by the Duke of Bridgewater, this is the greatest work in our island, fince the time of the Romans. It begins near the mouth of the Carron upon the Forth, and is raised by 20 locks, in a tract of 10 mi'es, to the amazing height of 155 feet above the full sea mark. From thence it is carried in some places through fost moss, in other places through folid rock. Besides the locks, which are 20 seet wide, and 75 feet long, it is eroffed by 18 roads or draw-bridges; and at Falkirk, it is carried over the great road, by means of an aqueduct bridge. By the same kind of bridges it is also carried over a number of rivers, of which the water of Logie near Kirkintulloch is the principal, and here the arch of the aqueduct bridge is 90 feet wide. The canal is 50 feet in breadth, at the surface; 7 feet deep, and navigable for sea vessels of 80 or 90 tons. Its proposed length is 30 miles, of which 24 have been finished by a subscription of 150,000l. beyond which the proprietors are unwilling to proceed; and the work hath consequently remained in statu quo, since the year 1775, when the people were discharged from their labour. It stops at the large river Kelvin, over which it must be carried, at an expence of some thousand pounds; besides nineteen locks, to convey it through a rough country, into the Clyde. The fubscribers, to indemnify themselves for the large sum already expended upon this incomplete navigation, have been obliged to levy a toll far too high for bulky goods in general, and which, on fome articles, amounts nearly to a prohibition.

At a short distance beyond Kilsyth, the road to Stirling takes a northern direction, and gradually opens a view of the Forth, which, from the Queen's Ferry to Alloa, hath all the appearances of an

extensive inland lake. Stirling is built upon a hill environed with rich plains; and rises, like Edinburgh (of which it is the miniature), in a gentle ascent wellward, where it is bounded by a perpendicular, losty rock, called the Castle, once the seat of kings, and the national councils. The royal palace serves at present as barracks to a few invalids; the parliament house, their lumber room. (This building is 120 feet in length, and of proportionable height. It hath been stripped, in the true Scottish manner, of its ornaments and galleries; the roof, unaffifted by the public, is mouldering away; and of the royal gardens fome few vestiges only can now be traced.

The views, which claim the preference, in Scotland, are those from Cantire, and Stirling Cattle; the first, as the reader will perceive by the map, are of kingdoms, islands, seas, promontories, and far distant shores. Those from Stirling are purely inland, displaying all the beauties and softness of an Italian landscape, agreeably intermixed with feas, plantations, and lofty downs or freep-walks. Amidst this feenery, the river Forth winds, in a most picturesque manner, to Alloa, forming, in the short tract of

113

fix miles by land, a navigation of twenty-four miles or upwards. Above Stirling, the landscape is equally engaging, if not more to, Here the windings of the Forth are less frequent, but more extenfive. This western view is bounded by Ben-Lomond, and the Grampian mountains, whose summits are perceived from every

direction throughout the centre of the kingdom.

The distance from Stirling to Edinburgh by the Queen's Ferry is thirty fix miles. The first stage to Falkirk commands an extensive view of both sides of the Forth; the rich plain, called the Carfe of Falkirk, the carron manufactory, famous for its cannon, and an endlets variety of tools and furniture in cast iron. Near Falkirk the traveller passes under the aqueduct bridge formerly mentioned; and at this place also the canal is raised above one hundred feet in the course of a mile, by means of ten locks, and at the expence of 18,000 pounds; one of the most extraordinary works of art in these kingdoms, and which nothing but ocular demonstration could convince of its reality. A most delightful journey, upon the fouth banks of the Forth where that river is above three miles wide, leads to the elevated and magnificent feat of the earl of Hopeton, fituated above the narrow strait at the Queen's Ferry, and commanding a complete view of the river and its islands, from the sea to Stirling.

A short and pleasant stage, through a well inclosed country, carries the traveller to the base of Edinburgh castle, which, though he hath lately traversed the Grampian mountains, will command

his admiration.

Travellers who entered Scotland by the eastern roads, through Berwic or Kelfo, generally return by the west, through Carlisle. The first stage from Edinburgh rises to a considerable elevation above that city, and affords, at the distance of ten miles southward, a most extensive view of the Forth, the Lothians, and the country of Fife, overtoped by the summits of far distant mountains.

Here the traveller takes a final leave of the northern Caledonia; and having passed the narrow ridge of hills which crosses that part of the kingdom from fea to fea, he is carried through a paitoral country, amidst verdant downs, rural streams, and long wind-

ing folitary vales.

In passing these extensive tracts, he will have sufficient leisure to contemplate the works of God as having been exhibited to his view, in a boundless variety of forms and appearances, and all designed for valuable purpoles, which it is the business of man to discover and improve. This will bring to mind what hath been done, and what remains to be done; the vast tracts of country, yet in a state of nature; the many thousands of sober, well disposed people, who are thereby lost to themselves, their families and the state. He will perceive that the kingdom through which he hath passed, its vallies, seas, lakes, and islands, is a great store yet in reserve for the aid of a dismembered empire, in strength, in commerce, and national consequence, whenever government shall be disposed to call forth these important sources.
